Typographic Conventions

name; ^{Fu} name; ^M name; ^{sO} name; ^{gF} name; ^{var} *name*; ^{co} name	▷ Symbol defined in Common Lisp; esp. function, macro, special operator, generic function, variable, constant.
them	▷ Placeholder for actual code.
me	▷ Literal text.
[foo _{bar}]	▷ Either one <i>foo</i> or nothing; defaults to bar .
foo*; {foo}*	▷ Zero or more <i>foos</i> .
foo ⁺ ; {foo} ⁺	▷ One or more <i>foos</i> .
foos	▷ English plural denotes a list argument.
{foo bar baz}; { ^{foo} bar ^{bar} baz}	▷ Either <i>foo</i> , or <i>bar</i> , or <i>baz</i> .
{ ^{foo} bar ^{bar} baz}	▷ Anything from none to each of <i>foo</i> , <i>bar</i> , and <i>baz</i> .
\widehat{foo}	▷ Argument <i>foo</i> is not evaluated.
\widetilde{bar}	▷ Argument <i>bar</i> is possibly modified.
foo ^R *	▷ <i>foo</i> * is evaluated as in ^{sO} progn ; see p. 19.
$\frac{foo; bar; baz}{2} \frac{}{n}$	▷ Primary, secondary, and <i>n</i> th return value.
T; NIL	▷ t , or truth in general; and nil or () .

1 Numbers

1.1 Predicates

$(\stackrel{\text{Fu}}{=} \text{number}^+)$
 $(\stackrel{\text{Fu}}{\neq} \text{number}^+)$ ▷ T if all *numbers*, or none, respectively, are equal in value.

$(\stackrel{\text{Fu}}{>} \text{number}^+)$
 $(\stackrel{\text{Fu}}{>=} \text{number}^+)$
 $(\stackrel{\text{Fu}}{<} \text{number}^+)$
 $(\stackrel{\text{Fu}}{<=} \text{number}^+)$ ▷ Return T if *numbers* are monotonically decreasing, monotonically non-increasing, monotonically increasing, or monotonically non-decreasing, respectively.

$(\stackrel{\text{Fu}}{\text{minusp}} a)$
 $(\stackrel{\text{Fu}}{\text{zerop}} a)$ ▷ T if $a < 0$, $a = 0$, or $a > 0$, respectively.
 $(\stackrel{\text{Fu}}{\text{plusp}} a)$

$(\stackrel{\text{Fu}}{\text{evenp}} \text{integer})$ ▷ T if *integer* is even or odd, respectively.
 $(\stackrel{\text{Fu}}{\text{oddp}} \text{integer})$

$(\stackrel{\text{Fu}}{\text{numberp}} \text{foo})$
 $(\stackrel{\text{Fu}}{\text{realp}} \text{foo})$
 $(\stackrel{\text{Fu}}{\text{rationalp}} \text{foo})$
 $(\stackrel{\text{Fu}}{\text{floatp}} \text{foo})$ ▷ T if *foo* is of indicated type.
 $(\stackrel{\text{Fu}}{\text{integerp}} \text{foo})$
 $(\stackrel{\text{Fu}}{\text{complexp}} \text{foo})$
 $(\stackrel{\text{Fu}}{\text{random-state-p}} \text{foo})$

1.2 Numeric Functions

$(\stackrel{\text{Fu}}{+} a_{\square}^*)$ ▷ Return $\sum a$ or $\prod a$, respectively.
 $(\stackrel{\text{Fu}}{*} a_{\square}^*)$

$(\stackrel{\text{Fu}}{-} a \ b^*)$
 $(\stackrel{\text{Fu}}{/} a \ b^*)$ ▷ Return $\underline{a} - \sum b$ or $\underline{a} / \prod b$, respectively. Without any *bs*, return $\underline{-a}$ or $\underline{1/a}$, respectively.

$(\stackrel{\text{Fu}}{1+} a)$ ▷ Return $\underline{a+1}$ or $\underline{a-1}$, respectively.
 $(\stackrel{\text{Fu}}{1-} a)$

$(\stackrel{\text{M}}{\text{incf}} \text{place} [\text{delta}_{\square}])$
 $(\stackrel{\text{M}}{\text{decf}} \text{place} [\text{delta}_{\square}])$ ▷ Increment or decrement the value of *place* by *delta*. Return new value.

$(\stackrel{\text{Fu}}{\text{exp}} p)$ ▷ Return $\underline{e^p}$ or $\underline{b^p}$, respectively.
 $(\stackrel{\text{Fu}}{\text{expt}} b \ p)$

$(\stackrel{\text{Fu}}{\log} a \ [b])$ ▷ Return $\underline{\log_b a}$ or, without *b*, $\underline{\ln a}$.

$(\stackrel{\text{Fu}}{\text{sqrt}} n)$ ▷ $\underline{\sqrt{n}}$ in complex or natural numbers, respectively.
 $(\stackrel{\text{Fu}}{\text{isqrt}} n)$

$(\stackrel{\text{Fu}}{\text{lcm}} \text{integer}^*_{\square})$
 $(\stackrel{\text{Fu}}{\text{gcd}} \text{integer}^*)$ ▷ Least common multiple or greatest common denominator, respectively, of *integers*. (**gcd**) returns 0.

$\stackrel{\text{Co}}{\text{pi}}$ ▷ **long-float** approximation of π , Ludolph's number.

$(\stackrel{\text{Fu}}{\text{sin}} a)$
 $(\stackrel{\text{Fu}}{\text{cos}} a)$ ▷ $\underline{\sin a}$, $\underline{\cos a}$, or $\underline{\tan a}$, respectively. (*a* in radians.)
 $(\stackrel{\text{Fu}}{\text{tan}} a)$

$(\stackrel{\text{Fu}}{\text{asin}} a)$ ▷ $\underline{\arcsin a}$ or $\underline{\arccos a}$, respectively, in radians.
 $(\stackrel{\text{Fu}}{\text{acos}} a)$

$(\stackrel{\text{Fu}}{\text{atan}} a \ [b_{\square}])$ ▷ $\underline{\arctan \frac{a}{b}}$ in radians.

$(\stackrel{\text{Fu}}{\text{sinh}} a)$
 $(\stackrel{\text{Fu}}{\text{cosh}} a)$ ▷ $\underline{\sinh a}$, $\underline{\cosh a}$, or $\underline{\tanh a}$, respectively.
 $(\stackrel{\text{Fu}}{\text{tanh}} a)$

$(\overset{\text{Fu}}{\text{asinh}} a)$
 $(\overset{\text{Fu}}{\text{acosh}} a)$ \triangleright asinh a , acosh a , or atanh a , respectively.
 $(\overset{\text{Fu}}{\text{atanh}} a)$

$(\overset{\text{Fu}}{\text{cis}} a)$ \triangleright Return $e^{ia} = \cos a + i \sin a$.

$(\overset{\text{Fu}}{\text{conjugate}} a)$ \triangleright Return complex conjugate of a .

$(\overset{\text{Fu}}{\text{max}} \text{ num}^+)$
 $(\overset{\text{Fu}}{\text{min}} \text{ num}^+)$ \triangleright Greatest or least, respectively, of nums .

$\left\{ \begin{array}{l} \{\overset{\text{Fu}}{\text{round}}|\overset{\text{Fu}}{\text{round}}\} \\ \{\overset{\text{Fu}}{\text{floor}}|\overset{\text{Fu}}{\text{floor}}\} \\ \{\overset{\text{Fu}}{\text{ceiling}}|\overset{\text{Fu}}{\text{ceiling}}\} \\ \{\overset{\text{Fu}}{\text{truncate}}|\overset{\text{Fu}}{\text{truncate}}\} \end{array} \right\} n [d_{\square}]$
 \triangleright Return as integer or float, respectively, n/d rounded, or rounded towards $-\infty$, $+\infty$, or 0, respectively; and remain-
der.

$\left\{ \begin{array}{l} \overset{\text{Fu}}{\text{mod}} \\ \overset{\text{Fu}}{\text{rem}} \end{array} \right\} n d$
 \triangleright Same as floor or truncate, respectively, but return re-
mainder only.

$(\overset{\text{Fu}}{\text{random}} \text{ limit } [\text{state} \overset{\text{var}}{\text{random-state}}])$
 \triangleright Return non-negative random number less than limit , and
of the same type.

$(\overset{\text{Fu}}{\text{make-random-state}} [\{ \text{state} | \text{NIL} | \text{T} | \text{[any]} \}])$
 \triangleright Copy of random-state object state or of the current ran-
dom state; or a randomly initialized fresh random state.

$\overset{\text{var}}{\text{*random-state*}}$ \triangleright Current random state.

$(\overset{\text{Fu}}{\text{float-sign}} \text{ num-a } [\text{num-b}_{\square}])$
 \triangleright num-b with the sign of num-a .

$(\overset{\text{Fu}}{\text{signum}} n)$
 \triangleright Number of magnitude 1 representing sign or phase of n .

$(\overset{\text{Fu}}{\text{numerator}} \text{ rational})$
 $(\overset{\text{Fu}}{\text{denominator}} \text{ rational})$
 \triangleright Numerator or denominator, respectively, of rational 's
canonical form.

$(\overset{\text{Fu}}{\text{realpart}} \text{ number})$
 $(\overset{\text{Fu}}{\text{imagpart}} \text{ number})$
 \triangleright Real part or imaginary part, respectively, of number .

$(\overset{\text{Fu}}{\text{complex}} \text{ real } [\text{imag}_{\square}])$ \triangleright Make a complex number.

$(\overset{\text{Fu}}{\text{phase}} \text{ number})$ \triangleright Angle of number 's polar representation.

$(\overset{\text{Fu}}{\text{abs}} n)$ \triangleright Return $|n|$.

$(\overset{\text{Fu}}{\text{rational}} \text{ real})$
 $(\overset{\text{Fu}}{\text{rationalize}} \text{ real})$
 \triangleright Convert real to rational. Assume complete/limited accu-
racy for real .

$(\overset{\text{Fu}}{\text{float}} \text{ real } [\text{prototype} \text{ single-float}])$
 \triangleright Convert real into float with type of prototype .

1.3 Logic Functions

Negative integers are used in two's complement representation.

$(\overset{\text{Fu}}{\text{bool}} \text{ operation } \text{int-a } \text{int-b})$
 \triangleright Return value of bitwise logical *operation*. *operations* are

$\overset{\text{co}}{\text{bool-e-1}}$ \triangleright int-a.
 $\overset{\text{co}}{\text{bool-e-2}}$ \triangleright int-b.
 $\overset{\text{co}}{\text{bool-e-1}}$ \triangleright $\neg \text{int-a}$.
 $\overset{\text{co}}{\text{bool-e-2}}$ \triangleright $\neg \text{int-b}$.
 $\overset{\text{co}}{\text{bool-set}}$ \triangleright All bits set.
 $\overset{\text{co}}{\text{bool-clr}}$ \triangleright All bits zero.

^{Fu}
(lognot integer) $\triangleright \underline{\neg integer.}$

^{Fu}
(logeqv integer*)
^{Fu}
(logand integer*)
 \triangleright Return value of exclusive-nored or anded *integers*, respectively. Without any *integer*, return 1.

^{Fu}
(logandc1 int-a int-b) $\triangleright \underline{\neg int-a \wedge int-b.}$

^{Fu}
(logandc2 int-a int-b) $\triangleright \underline{int-a \wedge \neg int-b.}$

^{Fu}
(lognand int-a int-b) $\triangleright \underline{\neg(int-a \wedge int-b).}$

^{Fu}
(logxor integer*)
^{Fu}
(logior integer*)
 \triangleright Return value of exclusive-ored or ored *integers*, respectively. Without any *integer*, return 0.

^{Fu}
(logorc1 int-a int-b) $\triangleright \underline{\neg int-a \vee int-b.}$

^{Fu}
(logorc2 int-a int-b) $\triangleright \underline{int-a \vee \neg int-b.}$

^{Fu}
(lognor int-a int-b) $\triangleright \underline{\neg(int-a \vee int-b).}$

^{Fu}
(logbitp i integer)
 \triangleright T if zero-indexed *i*th bit of *integer* is set.

^{Fu}
(logtest int-a int-b)
 \triangleright Return T if there is any bit set in *int-a* which is set in *int-b* as well.

^{Fu}
(logcount int)
 \triangleright Number of 1 bits in *int* ≥ 0 , number of 0 bits in *int* < 0 .

1.4 Integer Functions

^{Fu}
(integer-length integer)
 \triangleright Number of bits necessary to represent *integer*.

^{Fu}
(ldb-test byte-spec integer)
 \triangleright Return T if any bit specified by *byte-spec* in *integer* is set.

^{Fu}
(ash integer count)
 \triangleright Return copy of *integer* arithmetically shifted left by *count* adding zeros at the right, or, for *count* < 0 , shifted right discarding bits.

^{Fu}
(ldb byte-spec integer)
 \triangleright Extract byte denoted by *byte-spec* from *integer*. **settable**.

$\left\{ \begin{matrix} \text{F}_{\text{u}} \\ \text{F}_{\text{u}} \\ \text{d}_{\text{pb}} \end{matrix} \right\} \text{int-}a \text{ byte-spec int-}b)$
 \triangleright Return *int-b* with bits denoted by *byte-spec* replaced by corresponding bits of *int-a*, or by the low (^{Fu}**byte-size** *byte-spec*) bits of *int-a*, respectively.

^{Fu}
(mask-field byte-spec integer)
 \triangleright Return copy of *integer* with all bits unset but those denoted by *byte-spec*. **settable**.

^{Fu}
(byte size position)
 \triangleright Byte specifier for a byte of *size* bits starting at a weight of 2^{position} .

^{Fu}
(byte-size byte-spec)
^{Fu}
(byte-position byte-spec)
 \triangleright Size or position, respectively, of *byte-spec*.

1.5 Implementation-Dependent

$\left. \begin{array}{l} \text{short-float} \\ \text{single-float} \\ \text{double-float} \\ \text{long-float} \end{array} \right\} \begin{array}{l} \text{epsilon} \\ \text{negative-epsilon} \end{array}$

▷ Smallest possible number making a difference when added or subtracted, respectively.

$\left. \begin{array}{l} \text{least-negative} \\ \text{least-negative-normalized} \\ \text{least-positive} \\ \text{least-positive-normalized} \end{array} \right\} \begin{array}{l} \text{short-float} \\ \text{single-float} \\ \text{double-float} \\ \text{long-float} \end{array}$

▷ Available numbers closest to -0 or $+0$, respectively.

$\left. \begin{array}{l} \text{most-negative} \\ \text{most-positive} \end{array} \right\} \begin{array}{l} \text{short-float} \\ \text{single-float} \\ \text{double-float} \\ \text{long-float} \\ \text{fixnum} \end{array}$

▷ Available numbers closest to $-\infty$ or $+\infty$, respectively.

$(\text{decode-float } n)$

$(\text{integer-decode-float } n)$

▷ Return significand, exponent, and sign of **float** n .

$(\text{scale-float } n \ [i])$

▷ With n 's radix b , return nb^i .

$(\text{float-radix } n)$

$(\text{float-digits } n)$

$(\text{float-precision } n)$

▷ Radix, number of digits in that radix, or precision in that radix, respectively, of float n .

$(\text{upgraded-complex-part-type } foo \ [environment_{\text{nil}}])$

▷ Type of most specialized **complex** number able to hold parts of type foo .

2 Characters

$(\text{characterp } foo)$

$(\text{standard-char-p } char)$ ▷ T if argument is of indicated type.

$(\text{graphic-char-p } character)$

$(\text{alpha-char-p } character)$

$(\text{alphanumericp } character)$

▷ T if $character$ is visible, alphabetic, or alphanumeric, respectively.

$(\text{upper-case-p } character)$

$(\text{lower-case-p } character)$

$(\text{both-case-p } character)$

▷ Return T if $character$ is uppercase, lowercase, or able to be in another case, respectively.

$(\text{digit-char-p } character \ [radix_{\text{10}}])$

▷ Return its weight if $character$ is a digit, or NIL otherwise.

$(\text{char= } character^+)$

$(\text{char/= } character^+)$

▷ Return T if all $characters$, or none, respectively, are equal.

$(\text{char-equal } character^+)$

$(\text{char-not-equal } character^+)$

▷ Return T if all $characters$, or none, respectively, are equal ignoring case.

$(\text{char> } character^+)$

$(\text{char}>= \text{ } character^+)$

$(\text{char< } character^+)$

$(\text{char}<= \text{ } character^+)$

▷ Return T if $characters$ are monotonically decreasing, monotonically non-increasing, monotonically increasing, or monotonically non-decreasing, respectively.

$\left\{ \begin{array}{l} \text{string-trim} \\ \text{string-left-trim} \\ \text{string-right-trim} \end{array} \right\}$ *char-bag string*)
 ▷ Return string with all characters in sequence *char-bag* removed from both ends, from the beginning, or from the end, respectively.

char *string i*)
 schar *string i*)
 ▷ Return zero-indexed ith character of string ignoring/obeying, respectively, fill pointer. **setfable**.

parse-integer *string* $\left\{ \begin{array}{l} \text{:start } \text{start}_{\text{0}} \\ \text{:end } \text{end}_{\text{NIL}} \\ \text{:radix } \text{int}_{\text{10}} \\ \text{:junk-allowed } \text{bool}_{\text{NIL}} \end{array} \right\}$)
 ▷ Return integer parsed from *string* and index of parse end.

4 Conses

4.1 Predicates

cons *foo*)
 listp *foo*) ▷ Return T if *foo* is of indicated type.

endp *list*)
 null *foo*) ▷ Return T if *list/foo* is NIL.

atom *foo*) ▷ Return T if *foo* is not a **cons**.

tailp *foo list*) ▷ Return T if *foo* is a tail of *list*.

member *foo list* $\left\{ \begin{array}{l} \text{:test function}_{\text{\#*eq\#}} \\ \text{:test-not function} \\ \text{:key function} \end{array} \right\}$)
 ▷ Return tail of list starting with its first element matching *foo*. Return NIL if there is no such element.

$\left\{ \begin{array}{l} \text{member-if} \\ \text{member-if-not} \end{array} \right\}$ *test list* :key function)
 ▷ Return tail of *list* starting with its first element satisfying *test*. Return NIL if there is no such element.

subsetp *list-a list-b* $\left\{ \begin{array}{l} \text{:test function}_{\text{\#*eq\#}} \\ \text{:test-not function} \\ \text{:key function} \end{array} \right\}$)
 ▷ Return T if *list-a* is a subset of *list-b*.

4.2 Lists

cons *foo bar*) ▷ Return new cons (*foo . bar*).

list *foo**) ▷ Return list of foos.

list* *foo**)
 ▷ Return list of foos with last *foo* becoming cdr of last cons. Return foo if only one *foo* given.

make-list *num* $\text{:initial-element } \text{foo}_{\text{NIL}}$)
 ▷ New list with *num* elements set to *foo*.

list-length *list*) ▷ Length of *list*; NIL for circular *list*.

car *list*) ▷ car of *list* or NIL if *list* is NIL. **setfable**.

cdr *list*)
 rest *list*) ▷ cdr of *list* or NIL if *list* is NIL. **setfable**.

nthcdr *n list*) ▷ Return tail of list after calling cdr *n* times.

$\left\{ \text{first} \mid \text{second} \mid \text{third} \mid \text{fourth} \mid \text{fifth} \mid \text{sixth} \mid \dots \mid \text{ninth} \mid \text{tenth} \right\}$ *list*)
 ▷ Return nth element of list if any, or NIL otherwise. **setfable**.

nth *n list*)
 ▷ Return zero-indexed nth element of *list*. **setfable**.

untrace $\left\{ \begin{array}{l} \text{function} \\ \text{(setf function)} \end{array} \right\}^*$)
 ▷ Stop functions, or each currently traced function, from being traced.

trace-output*
 ▷ Stream trace and time print their output on.

step *form*)
 ▷ Step through evaluation of *form*. Return values of form.

break [*control arg**])
 ▷ Jump directly into debugger; return NIL. See p. 34, format , for *control* and *args*.

time *form*)
 ▷ Evaluate *forms* and print timing information to trace-output* . Return values of form.

inspect *foo*) ▷ Interactively give information about *foo*.

describe *foo* [*stream* standard-output*])
 ▷ Send information about *foo* to *stream*.

describe-object *foo* [*stream*])
 ▷ Send information about *foo* to *stream*. Not to be called by user.

disassemble *function*)
 ▷ Send disassembled representation of *function* to standard-output* . Return NIL.

15.4 Declarations

proclaim *decl*)
 declaim $\widehat{\text{decl}}^*$)
 ▷ Globally make declaration(s) *decl*. *decl* can be: **declaration**, **type**, **ftype**, **inline**, **notinline**, **optimize**, or **special**. See below.

declare $\widehat{\text{decl}}^*$)
 ▷ Inside certain forms, locally make declarations *decl**. *decl* can be: **dynamic-extent**, **type**, **ftype**, **ignorable**, **ignore**, **inline**, **notinline**, **optimize**, or **special**. See below.

$\text{(declaration } \text{foo}^*)$
 ▷ Make *foos* names of declarations.

$\text{(dynamic-extent } \text{variable}^* \text{ (function } \text{function})}^*)$
 ▷ Declare lifetime of *variables* and/or *functions* to end when control leaves enclosing block.

$\text{[type] } \text{type } \text{variable}^*)$
 $\text{(ftype } \text{type } \text{function}^*)$
 ▷ Declare *variables* or *functions* to be of *type*.

$\left\{ \begin{array}{l} \text{ignorable} \\ \text{ignore} \end{array} \right\} \left\{ \begin{array}{l} \text{var} \\ \text{(function } \text{function})} \end{array} \right\}^*$
 ▷ Suppress warnings about used/unused bindings.

$\text{(inline } \text{function}^*)$
 $\text{(notinline } \text{function}^*)$
 ▷ Tell compiler to integrate/not to integrate, respectively, called *functions* into the calling routine.

$\text{(optimize } \left\{ \begin{array}{l} \text{compilation-speed} \mid \text{(compilation-speed } \text{num}_{\text{0}}) \\ \text{debug} \mid \text{(debug } \text{num}_{\text{0}}) \\ \text{safety} \mid \text{(safety } \text{num}_{\text{0}}) \\ \text{space} \mid \text{(space } \text{num}_{\text{0}}) \\ \text{speed} \mid \text{(speed } \text{num}_{\text{0}}) \end{array} \right\})$
 ▷ Tell compiler how to optimize. *n* = 0 means unimportant, *n* = 1 is neutral, *n* = 3 means important.

$\text{(special } \text{var}^*)$ ▷ Declare *vars* to be dynamic.

(^{SO}locally (declare \widehat{decl}^*)^{P_k} $form^*$)

▷ Evaluate *forms* in a lexical environment with declarations *decl* in effect. Return values of forms.

(^Mwith-compilation-unit ([^{Fu}override $\widehat{bool}_{\text{NIL}}$]) $form^*$)

▷ Return values of forms. Warnings deferred by the compiler until end of compilation are deferred until the end of evaluation of *forms*.

(^{SO}load-time-value $form$ [$\widehat{read-only}_{\text{NIL}}$])

▷ Evaluate *form* at compile time and treat its value as literal at run time.

(^{SO}quote \widehat{foo}) ▷ Return unevaluated foo.

(^{GF}make-load-form foo [*environment*])

▷ Its methods are to return a creation form which on evaluation at load time returns an object equivalent to *foo*, and an optional initialization form which on evaluation performs some initialization of the object.

(^{Fu}make-load-form-saving-slots foo $\left\{ \begin{array}{l} \text{:slot-names } \widehat{slots}_{\text{all local slots}} \\ \text{:environment } \widehat{environment} \end{array} \right\}$)

▷ Return a creation form and an initialization form which on evaluation construct an object equivalent to *foo* with *slots* initialized with the corresponding values from *foo*.

(^{Fu}macro-function $symbol$ [*environment*])

(^{Fu}compiler-macro-function $\left\{ \begin{array}{l} \text{name} \\ \text{:setf name} \end{array} \right\}$ [*environment*])

▷ Return specified macro function, or compiler macro function, respectively, if any. Return NIL otherwise. setfable.

(^{Fu}eval arg)

▷ Return values of value of arg evaluated in global environment.

15.3 REPL and Debugging

```
var|var|var|var|
+|+|+|+|
var|var|var|var|
*|*|*|*|
var|var|var|var|
//|//|//|//|
```

▷ Last, penultimate, or antepenultimate form evaluated in the REPL, or their respective primary value, or a list of their respective values.

^{var}— ▷ Form currently being evaluated by the REPL.

(^{Fu}apropos $string$ [$\widehat{package}_{\text{NIL}}$])

▷ Print interned symbols containing *string*.

(^{Fu}apropos-list $string$ [$\widehat{package}_{\text{NIL}}$])

▷ List of interned symbols containing *string*.

(^{Fu}dribble [\widehat{path}])

▷ Save a record of interactive session to file at *path*. Without *path*, close that file.

(^{Fu}ed [$\widehat{file-or-function}_{\text{NIL}}$]) ▷ Invoke editor if possible.

(^{Fu}macroexpand-1 $form$ [$\widehat{environment}_{\text{NIL}}$])

▷ Return macro expansion, once or entirely, respectively, of *form* and T if *form* was a macro form. Return form and NIL otherwise.

^{var}*macroexpand-hook*

▷ Function of arguments expansion function, macro form, and environment called by ^{Fu}macroexpand-1 to generate macro expansions.

(^Mtrace $\left\{ \begin{array}{l} \text{function} \\ \text{:setf function} \end{array} \right\}^*$)

▷ Cause *functions* to be traced. With no arguments, return list of traced functions.

(^{Fu}cXr $list$)

▷ With *X* being one to four **as** and **ds** representing ^{Fu}cars and ^{Fu}cdrs, e.g. (^{Fu}cadr *bar*) is equivalent to (^{Fu}car (^{Fu}cdr *bar*)). setfable.

(^{Fu}last $list$ [$\widehat{num}_{\text{NIL}}$]) ▷ Return list of last num conses of *list*.

(^{Fu}butlast $list$ [$\widehat{num}_{\text{NIL}}$])

▷ Return list excluding last *num* conses.

(^{Fu}rplaca \widehat{cons} *object*)

▷ Replace car, or cdr, respectively, of cons with *object*.

(^{Fu}ldiff $list$ *foo*)

▷ If *foo* is a tail of *list*, return preceding part of list. Otherwise return list.

(^{Fu}adjoin foo $list$ $\left\{ \begin{array}{l} \text{:test function}_{\text{#eq}} \\ \text{:test-not function} \\ \text{:key function} \end{array} \right\}$)

▷ Return list if *foo* is already member of *list*. If not, return (^{Fu}cons *foo list*).

(^Mpop \widehat{place}) ▷ Set *place* to (^{Fu}cdr *place*), return (^{Fu}car *place*).

(^Mpush foo \widehat{place}) ▷ Set *place* to (^{Fu}cons *foo place*).

(^Mpushnew foo \widehat{place} $\left\{ \begin{array}{l} \text{:test function}_{\text{#eq}} \\ \text{:test-not function} \\ \text{:key function} \end{array} \right\}$)

▷ Set *place* to (^{Fu}adjoin *foo place*).

(^{Fu}append [\widehat{list}^* *foo*])

(^{Fu}nconc [\widehat{list}^* *foo*])

▷ Return concatenated list. *foo* can be of any type.

(^{Fu}revappend $list$ *foo*)

(^{Fu}nreconc $list$ *foo*)

▷ Return concatenated list after reversing order in *list*.

(^{Fu}mapcar $function$ $list^+$)

▷ Return list of return values of *function* successively invoked with corresponding arguments, either cars or cdrs, respectively, from each *list*.

(^{Fu}mapcan $function$ $list^+$)

▷ Return list of concatenated return values of *function* successively invoked with corresponding arguments, either cars or cdrs, respectively, from each *list*. *function* should return a list.

(^{Fu}mapc $function$ $list^+$)

▷ Return first list after successively applying *function* to corresponding arguments, either cars or cdrs, respectively, from each *list*. *function* should have some side effects.

(^{Fu}copy-list $list$) ▷ Return copy of *list* with shared elements.

4.3 Association Lists

(^{Fu}pairlis $keys$ $values$ [$\widehat{alist}_{\text{NIL}}$])

▷ Prepend to alist an association list made from lists *keys* and *values*.

(^{Fu}acons key $value$ *alist*)

▷ Return alist with a (*key* . *value*) pair added.

(^{Fu}assoc foo *alist* $\left\{ \begin{array}{l} \text{:test test}_{\text{#eq}} \\ \text{:test-not test} \\ \text{:key function} \end{array} \right\}$)

(^{Fu}assoc-if[-not] $test$ *alist* [*key function*])

▷ First cons whose car, or cdr, respectively, satisfies *test*.

(^{Fu}copy-alist *alist*) ▷ Return copy of *alist*.

4.4 Trees

$(\text{tree-equal}^{\text{Fu}} \text{foo bar} \left\{ \begin{array}{l} \text{:test } \text{test}^{\text{Fu}} \text{eq} \\ \text{:test-not } \text{test} \end{array} \right\})$

▷ Return T if trees *foo* and *bar* have same shape and leaves satisfying *test*.

$\left\{ \begin{array}{l} \text{subst}^{\text{Fu}} \text{ new old tree} \\ \text{subst}^{\text{Fu}} \text{ new old tree} \end{array} \right\} \left\{ \begin{array}{l} \text{:test function}^{\text{Fu}} \text{eq} \\ \text{:test-not function} \\ \text{:key function} \end{array} \right\}$

▷ Make copy of *tree* with each subtree or leaf matching *old* replaced by *new*.

$\left\{ \begin{array}{l} \text{subst-if}^{\text{Fu}} \text{[-not] new test tree} \\ \text{subst-if}^{\text{Fu}} \text{[-not] new test tree} \end{array} \right\} [\text{:key function}]$

▷ Make copy of *tree* with each subtree or leaf satisfying *test* replaced by *new*.

$\left\{ \begin{array}{l} \text{sublis}^{\text{Fu}} \text{ association-list tree} \\ \text{sublis}^{\text{Fu}} \text{ association-list tree} \end{array} \right\} \left\{ \begin{array}{l} \text{:test function}^{\text{Fu}} \text{eq} \\ \text{:test-not function} \\ \text{:key function} \end{array} \right\}$

▷ Make copy of *tree* with each subtree or leaf matching a key in *association-list* replaced by that key's value.

$(\text{copy-tree}^{\text{Fu}} \text{tree})$ ▷ Copy of *tree* with same shape and leaves.

4.5 Sets

$\left\{ \begin{array}{l} \text{intersection}^{\text{Fu}} \\ \text{set-difference}^{\text{Fu}} \\ \text{union}^{\text{Fu}} \\ \text{set-exclusive-or}^{\text{Fu}} \\ \text{intersection}^{\text{Fu}} \\ \text{nset-difference}^{\text{Fu}} \\ \text{nunion}^{\text{Fu}} \\ \text{nset-exclusive-or}^{\text{Fu}} \end{array} \right\} \left\{ \begin{array}{l} a \ b \\ \tilde{a} \ b \\ \tilde{a} \ \tilde{b} \end{array} \right\} \left\{ \begin{array}{l} \text{:test function}^{\text{Fu}} \text{eq} \\ \text{:test-not function} \\ \text{:key function} \end{array} \right\}$

▷ Return $a \cap b$, $a \setminus b$, $a \cup b$, or $a \triangle b$, respectively, of lists *a* and *b*.

5 Arrays

5.1 Predicates

$(\text{arrayp}^{\text{Fu}} \text{foo})$

$(\text{vectorp}^{\text{Fu}} \text{foo})$

$(\text{simple-vector-p}^{\text{Fu}} \text{foo})$ ▷ T if *foo* is of indicated type.

$(\text{bit-vector-p}^{\text{Fu}} \text{foo})$

$(\text{simple-bit-vector-p}^{\text{Fu}} \text{foo})$

$(\text{adjustable-array-p}^{\text{Fu}} \text{array})$

$(\text{array-has-fill-pointer-p}^{\text{Fu}} \text{array})$

▷ Return T if *array* is adjustable/has a fill pointer, respectively.

$(\text{array-in-bounds-p}^{\text{Fu}} \text{array} [\text{subscripts}])$

▷ Return T if *subscripts* are in *array*'s bounds.

5.2 Array Functions

$\left\{ \begin{array}{l} \text{make-array}^{\text{Fu}} \text{ dimension-sizes} [\text{:adjustable } \text{bool}^{\text{Fu}} \text{nil}] \\ \text{adjust-array}^{\text{Fu}} \text{ array dimension-sizes} \\ \left\{ \begin{array}{l} \text{:element-type } \text{type}^{\text{Fu}} \\ \text{:fill-pointer } \{ \text{num}^{\text{Fu}} \text{bool}^{\text{Fu}} \text{nil} \} \\ \text{:initial-element } \text{obj} \\ \text{:initial-contents } \text{sequence} \\ \text{:displaced-to } \text{array}^{\text{Fu}} [\text{:displaced-index-offset } \text{i}^{\text{Fu}}] \end{array} \right\} \end{array} \right\}$

▷ Return fresh, or readjust, respectively, *vector* or *array*.

$(\text{aref}^{\text{Fu}} \text{array} [\text{subscripts}])$

▷ Return *array* element pointed to by *subscripts*. **setfable**.

$(\text{row-major-aref}^{\text{Fu}} \text{array } i)$

▷ Return *i*th element of *array* in row-major order. **setfable**.

t^{Co}

▷ Truth; the supertype of every type including **t**; the superclass of every class except **t**; ***terminal-io***.

nil^{Co}

▷ Falsity; the empty list; the empty type, subtype of every type; ***standard-input***; ***standard-output***; the global environment.

14.4 Standard Packages

common-lisp|cl

▷ Exports the defined names of Common Lisp except for those in the **keyword** package.

common-lisp-user|cl-user

▷ Current package after startup; uses package **common-lisp**.

keyword

▷ Contains symbols which are defined to be of type **keyword**.

15 Compiler

15.1 Predicates

$(\text{special-operator-p}^{\text{Fu}} \text{foo})$ ▷ T if *foo* is a special operator.

$(\text{compiled-function-p}^{\text{Fu}} \text{foo})$

▷ T if *foo* is of type **compiled-function**.

15.2 Compilation

$(\text{compile}^{\text{Fu}} \left\{ \begin{array}{l} \text{NIL definition} \\ \left\{ \begin{array}{l} \text{name} \\ \text{(setf name)} \end{array} \right\} [\text{definition}] \end{array} \right\})$

▷ Return compiled function or replace *name*'s function definition with the compiled function. Return T in case of warnings or errors, and T in case of warnings or errors excluding style warnings.

$(\text{compile-file}^{\text{Fu}} \text{file} \left\{ \begin{array}{l} \text{:output-file } \text{out-path} \\ \text{:verbose } \text{bool}^{\text{Fu}} [\text{*compile-verbose*}] \\ \text{:print } \text{bool}^{\text{Fu}} [\text{*compile-print*}] \\ \text{:external-format } \text{file-format}^{\text{Fu}} [\text{default}] \end{array} \right\})$

▷ Write compiled contents of *file* to *out-path*. Return *true* output path or *NIL*, T in case of warnings or errors, T in case of warnings or errors excluding style warnings.

$(\text{compile-file-pathname}^{\text{Fu}} \text{file} [\text{:output-file } \text{path}] [\text{other-keyargs}])$

▷ Pathname *compile-file* writes to if invoked with the same arguments.

$(\text{load}^{\text{Fu}} \text{path} \left\{ \begin{array}{l} \text{:verbose } \text{bool}^{\text{Fu}} [\text{*load-verbose*}] \\ \text{:print } \text{bool}^{\text{Fu}} [\text{*load-print*}] \\ \text{:if-does-not-exist } \text{bool}^{\text{Fu}} \\ \text{:external-format } \text{file-format}^{\text{Fu}} [\text{default}] \end{array} \right\})$

▷ Load source file or compiled file into Lisp environment. Return T if successful.

$\text{*compile-file}^{\text{var}} \left\{ \begin{array}{l} \text{pathname}^{\text{Fu}} \\ \text{truenam}^{\text{Fu}} \end{array} \right\}$

▷ Input file used by *compile-file*/by *load*.

$\text{*compile}^{\text{var}} \left\{ \begin{array}{l} \text{print}^{\text{Fu}} \\ \text{verbose}^{\text{Fu}} \end{array} \right\}$

▷ Defaults used by *compile-file*/by *load*.

$(\text{eval-when}^{\text{So}} \left(\left\{ \begin{array}{l} \text{:compile-toplevel|compile} \\ \text{:load-toplevel|load} \\ \text{:execute|eval} \end{array} \right\} \right) \text{form}^{\text{P}})$

▷ Return values of *forms* if *eval-when* is in the top-level of a file being compiled, in the top-level of a compiled file being loaded, or anywhere, respectively. Return *NIL* if *forms* are not evaluated. (**compile**, **load** and **eval** deprecated.)

$\left\{ \begin{array}{l} \text{import} \\ \text{shadowing-import} \end{array} \right\}^{\text{Fu}} \text{ symbols } [\text{package-} \text{var} \text{ *package*}])$
 ▷ Make *symbols* internal to *package*. Return T. In case of a name conflict signal correctable **package-error** or shadow the old symbol, respectively.

$(\text{shadow } \text{symbols } [\text{package-} \text{var} \text{ *package*}])^{\text{Fu}}$
 ▷ Add *symbols* to shadowing list of *package* making equally named inherited symbols shadowed. Return T.

$(\text{package-shadowing-symbols } \text{package})^{\text{Fu}}$
 ▷ List of shadowing symbols of *package*.

$(\text{export } \text{symbols } [\text{package-} \text{var} \text{ *package*}])^{\text{Fu}}$
 ▷ Make *symbols* external to *package*. Return T.

$(\text{unexport } \text{symbols } [\text{package-} \text{var} \text{ *package*}])^{\text{Fu}}$
 ▷ Revert *symbols* to internal status. Return T.

$\left\{ \begin{array}{l} \text{do-symbols} \\ \text{do-external-symbols} \\ \text{do-all-symbols} \end{array} \right\}^{\text{M}} (\text{var } [\text{package-} \text{var} \text{ *package*}] [\text{result-} \text{NIL}])$
 $(\text{declare } \widehat{\text{decl}}^*)^* \left\{ \begin{array}{l} \text{tag} \\ \text{form} \end{array} \right\}^*$
 ▷ Evaluate $\widehat{\text{tagbody}}$ -like body with *var* successively bound to every symbol from *package*, to every external symbol from *package*, or to every symbol from all registered packages, respectively. Return values of *result*. Implicitly, the whole form is a **block** named NIL.

$(\text{with-package-iterator } (\text{foo } \text{packages } [\text{:internal} | \text{:external} | \text{:inherited}])^{\text{M}})$
 $(\text{declare } \widehat{\text{decl}}^*)^* \text{ form}^{\text{Pk}}$
 ▷ Return values of *forms*. In *forms*, successive invocations of (*foo*) return: T if a symbol is returned; a symbol from *packages*; accessibility (:internal, :external, or :inherited); and the package the symbol belongs to.

$(\text{require } \text{module } [\text{path-list-} \text{NIL}])^{\text{Fu}}$
 ▷ If not in $\text{var } \text{*modules*}$, try paths in *path-list* to load module from. Signal **error** if unsuccessful. Deprecated.

$(\text{provide } \text{module})^{\text{Fu}}$
 ▷ If not already there, add *module* to $\text{var } \text{*modules*}$. Deprecated.

$\text{var } \text{*modules*}$ ▷ List of names of loaded modules.

14.3 Symbols

A **symbol** has the attributes *name*, home **package**, property list, and optionally value (of global constant or variable *name*) and function (**function**, macro, or special operator *name*).

$(\text{make-symbol } \text{name})^{\text{Fu}}$
 ▷ Make fresh, uninterned symbol *name*.

$(\text{gensym } [\text{s} \text{NIL}])^{\text{Fu}}$
 ▷ Return fresh, uninterned symbol $\#:\text{s}n$ with *n* from $\text{var } \text{*gensym-counter*}$. Increment $\text{var } \text{*gensym-counter*}$.

$(\text{gentemp } [\text{prefix-} \text{NIL} [\text{package-} \text{var} \text{ *package*}]])^{\text{Fu}}$
 ▷ Intern fresh symbol in *package*. Deprecated.

$(\text{copy-symbol } \text{symbol } [\text{props-} \text{NIL}])^{\text{Fu}}$
 ▷ Return uninterned copy of *symbol*. If *props* is T, give copy the same value, function and property list.

$(\text{symbol-name } \text{symbol})^{\text{Fu}}$
 $(\text{symbol-package } \text{symbol})^{\text{Fu}}$
 $(\text{symbol-plist } \text{symbol})^{\text{Fu}}$
 $(\text{symbol-value } \text{symbol})^{\text{Fu}}$
 $(\text{symbol-function } \text{symbol})^{\text{Fu}}$
 ▷ Name, package, property list, value, or function, respectively, of *symbol*. **setfable**.

$\left\{ \begin{array}{l} \text{documentation} \\ (\text{setf } \text{documentation}) \text{ new-doc} \end{array} \right\}^{\text{FF}} \text{ foo } \{ \text{'variable'} | \text{'function'} | \text{'compiler-macro'} | \text{'method-combination'} | \text{'structure'} | \text{'type'} | \text{'setf'} | \text{T} \}$
 ▷ Get/set documentation string of *foo* of given type.

$(\text{array-row-major-index } \text{array } [\text{subscripts}])^{\text{Fu}}$
 ▷ Index in row-major order of the element denoted by *subscripts*.

$(\text{array-dimensions } \text{array})^{\text{Fu}}$
 ▷ List containing the lengths of *array*'s dimensions.

$(\text{array-dimension } \text{array } i)^{\text{Fu}}$
 ▷ Length of *i*th dimension of *array*.

$(\text{array-total-size } \text{array})^{\text{Fu}}$ ▷ Number of elements in *array*.

$(\text{array-rank } \text{array})^{\text{Fu}}$ ▷ Number of dimensions of *array*.

$(\text{array-displacement } \text{array})^{\text{Fu}}$ ▷ Target array and offset.

$(\text{bit } \text{bit-array } [\text{subscripts}])^{\text{Fu}}$
 $(\text{sbit } \text{simple-bit-array } [\text{subscripts}])^{\text{Fu}}$
 ▷ Return element of *bit-array* or of *simple-bit-array*. **setfable**.

$(\text{bit-not } \text{bit-array } [\text{result-bit-array-} \text{NIL}])^{\text{Fu}}$
 ▷ Return result of bitwise negation of *bit-array*. If *result-bit-array* is T, put result in *bit-array*; if it is NIL, make a new array for result.

$\left\{ \begin{array}{l} \text{bit-eqv} \\ \text{bit-and} \\ \text{bit-andc1} \\ \text{bit-andc2} \\ \text{bit-nand} \\ \text{bit-ior} \\ \text{bit-iorc1} \\ \text{bit-iorc2} \\ \text{bit-xor} \\ \text{bit-nor} \end{array} \right\}^{\text{Fu}} \text{ bit-array-a bit-array-b } [\text{result-bit-array-} \text{NIL}])$
 ▷ Return result of bitwise logical operations (cf. operations of **boole**, p. 4) on *bit-array-a* and *bit-array-b*. If *result-bit-array* is T, put result in *bit-array-a*; if it is NIL, make a new array for result.

$\text{array-rank-limit}^{\text{Co}}$ ▷ Upper bound of array rank; ≥ 8 .

$\text{array-dimension-limit}^{\text{Co}}$
 ▷ Upper bound of an array dimension; ≥ 1024 .

$\text{array-total-size-limit}^{\text{Co}}$ ▷ Upper bound of array size; ≥ 1024 .

5.3 Vector Functions

Vectors can as well be manipulated by sequence functions; see section 6.

$(\text{vector } \text{foo}^*)^{\text{Fu}}$ ▷ Return fresh simple vector of *foos*.

$(\text{svref } \text{vector } i)^{\text{Fu}}$ ▷ Return element *i* of simple *vector*. **setfable**.

$(\text{vector-push } \text{foo } \text{vector})^{\text{Fu}}$
 ▷ Return NIL if *vector*'s fill pointer equals size of *vector*. Otherwise replace element of *vector* pointed to by fill pointer with *foo*; then increment fill pointer.

$(\text{vector-push-extend } \text{foo } \text{vector } [\text{num}])^{\text{Fu}}$
 ▷ Replace element of *vector* pointed to by fill pointer with *foo*, then increment fill pointer. Extend *vector*'s size by $\geq \text{num}$ if necessary.

$(\text{vector-pop } \text{vector})^{\text{Fu}}$
 ▷ Return element of *vector* its fillpointer points to after decrementation.

$(\text{fill-pointer } \text{vector})^{\text{Fu}}$ ▷ Fill pointer of *vector*. **setfable**.

6 Sequences

6.1 Sequence Predicates

$\left\{ \begin{smallmatrix} \text{Fu} \\ \text{Fu} \end{smallmatrix} \right\} \text{every}$ $\left\{ \begin{smallmatrix} \text{Fu} \\ \text{Fu} \end{smallmatrix} \right\} \text{notevery}$ $\left\{ \begin{smallmatrix} \text{Fu} \\ \text{Fu} \end{smallmatrix} \right\} \text{test sequence}^+$

▷ Return NIL or T, respectively, as soon as *test* on any set of corresponding elements of *sequences* returns NIL.

$\left\{ \begin{smallmatrix} \text{Fu} \\ \text{Fu} \end{smallmatrix} \right\} \text{some}$ $\left\{ \begin{smallmatrix} \text{Fu} \\ \text{Fu} \end{smallmatrix} \right\} \text{notany}$ $\left\{ \begin{smallmatrix} \text{Fu} \\ \text{Fu} \end{smallmatrix} \right\} \text{test sequence}^+$

▷ Return value of test or NIL, respectively, as soon as *test* on any set of corresponding elements of *sequences* returns non-NIL.

$\left(\begin{smallmatrix} \text{Fu} \\ \text{Fu} \end{smallmatrix} \right) \text{mismatch sequence-a sequence-b} \left\{ \begin{smallmatrix} \text{:from-end bool} \text{NIL} \\ \text{:test function} \text{#'eq} \\ \text{:test-not function} \\ \text{:start1 start-a} \text{0} \\ \text{:start2 start-b} \text{0} \\ \text{:end1 end-a} \text{NIL} \\ \text{:end2 end-b} \text{NIL} \\ \text{:key function} \end{smallmatrix} \right\}$

▷ Return position in sequence-a where *sequence-a* and *sequence-b* begin to mismatch. Return NIL if they match entirely.

6.2 Sequence Functions

$\left(\begin{smallmatrix} \text{Fu} \\ \text{Fu} \end{smallmatrix} \right) \text{make-sequence sequence-type size [:initial-element foo]}$

▷ Make sequence of sequence-type with *size* elements.

$\left(\begin{smallmatrix} \text{Fu} \\ \text{Fu} \end{smallmatrix} \right) \text{concatenate type sequence}^*$

▷ Return concatenated sequence of *type*.

$\left(\begin{smallmatrix} \text{Fu} \\ \text{Fu} \end{smallmatrix} \right) \text{merge type sequence-a sequence-b test [:key function NIL]}$

▷ Return interleaved sequence of *type*. Merged sequence will be sorted if both *sequence-a* and *sequence-b* are sorted.

$\left(\begin{smallmatrix} \text{Fu} \\ \text{Fu} \end{smallmatrix} \right) \text{fill sequence foo} \left\{ \begin{smallmatrix} \text{:start start} \text{0} \\ \text{:end end} \text{NIL} \end{smallmatrix} \right\}$

▷ Return sequence after setting elements between *start* and *end* to *foo*.

$\left(\begin{smallmatrix} \text{Fu} \\ \text{Fu} \end{smallmatrix} \right) \text{length sequence}$

▷ Return length of sequence (being value of fill pointer if applicable).

$\left(\begin{smallmatrix} \text{Fu} \\ \text{Fu} \end{smallmatrix} \right) \text{count foo sequence} \left\{ \begin{smallmatrix} \text{:from-end bool} \text{NIL} \\ \text{:test function} \text{#'eq} \\ \text{:test-not function} \\ \text{:start start} \text{0} \\ \text{:end end} \text{NIL} \\ \text{:key function} \end{smallmatrix} \right\}$

▷ Return number of foos in *sequence* which satisfy tests.

$\left\{ \begin{smallmatrix} \text{Fu} \\ \text{Fu} \end{smallmatrix} \right\} \text{count-if}$ $\left\{ \begin{smallmatrix} \text{Fu} \\ \text{Fu} \end{smallmatrix} \right\} \text{count-if-not}$ $\left\{ \begin{smallmatrix} \text{Fu} \\ \text{Fu} \end{smallmatrix} \right\} \text{test sequence} \left\{ \begin{smallmatrix} \text{:from-end bool} \text{NIL} \\ \text{:start start} \text{0} \\ \text{:end end} \text{NIL} \\ \text{:key function} \end{smallmatrix} \right\}$

▷ Return number of elements in *sequence* which satisfy *test*.

$\left(\begin{smallmatrix} \text{Fu} \\ \text{Fu} \end{smallmatrix} \right) \text{elt sequence index}$

▷ Return element of sequence pointed to by zero-indexed *index*. setfable.

$\left(\begin{smallmatrix} \text{Fu} \\ \text{Fu} \end{smallmatrix} \right) \text{subseq sequence start [end NIL]}$

▷ Return subsequence of sequence between *start* and *end*. setfable.

$\left\{ \begin{smallmatrix} \text{Fu} \\ \text{Fu} \end{smallmatrix} \right\} \text{sort}$ $\left\{ \begin{smallmatrix} \text{Fu} \\ \text{Fu} \end{smallmatrix} \right\} \text{stable-sort}$ $\left\{ \begin{smallmatrix} \text{Fu} \\ \text{Fu} \end{smallmatrix} \right\} \text{sequence test [:key function]}$

▷ Return sequence sorted. Order of elements considered equal is not guaranteed/retained, respectively.

$\left(\begin{smallmatrix} \text{Fu} \\ \text{Fu} \end{smallmatrix} \right) \text{reverse sequence}$ $\left(\begin{smallmatrix} \text{Fu} \\ \text{Fu} \end{smallmatrix} \right) \text{nreverse sequence}$

▷ Return sequence in reverse order.

14 Packages and Symbols

14.1 Predicates

$\left(\begin{smallmatrix} \text{Fu} \\ \text{Fu} \end{smallmatrix} \right) \text{symbolp foo}$
 $\left(\begin{smallmatrix} \text{Fu} \\ \text{Fu} \end{smallmatrix} \right) \text{packagep foo}$ ▷ T if *foo* is of indicated type.
 $\left(\begin{smallmatrix} \text{Fu} \\ \text{Fu} \end{smallmatrix} \right) \text{keywordp foo}$

14.2 Packages

$\text{bar} \mid \text{keyword:bar}$ ▷ Keyword, evaluates to :bar.

package:symbol ▷ Exported *symbol* of *package*.

package::symbol ▷ Possibly unexported *symbol* of *package*.

$\left(\begin{smallmatrix} \text{M} \\ \text{M} \end{smallmatrix} \right) \text{defpackage foo} \left\{ \begin{smallmatrix} \text{:nicknames nick}^* \text{*} \\ \text{:documentation string} \\ \text{:intern interned-symbol}^* \text{*} \\ \text{:use used-package}^* \text{*} \\ \text{:import-from pkg imported-symbol}^* \text{*} \\ \text{:shadowing-import-from pkg shd-symbol}^* \text{*} \\ \text{:shadow shd-symbol}^* \text{*} \\ \text{:export exported-symbol}^* \text{*} \\ \text{:size int} \end{smallmatrix} \right\}$

▷ Create or modify package foo with *interned-symbols*, symbols from *used-packages*, *imported-symbols*, and *shd-symbols*. Add *shd-symbols* to *foo*'s shadowing list.

$\left(\begin{smallmatrix} \text{Fu} \\ \text{Fu} \end{smallmatrix} \right) \text{make-package foo} \left\{ \begin{smallmatrix} \text{:nicknames (nick}^* \text{NIL)} \\ \text{:use (used-package}^* \text{)} \end{smallmatrix} \right\}$

▷ Create package foo.

$\left(\begin{smallmatrix} \text{Fu} \\ \text{Fu} \end{smallmatrix} \right) \text{rename-package package new-name [new-nicknames NIL]}$

▷ Rename *package*. Return renamed package.

$\left(\begin{smallmatrix} \text{M} \\ \text{M} \end{smallmatrix} \right) \text{in-package foo}$ ▷ Make package foo current.

$\left\{ \begin{smallmatrix} \text{Fu} \\ \text{Fu} \end{smallmatrix} \right\} \text{use-package}$ $\left\{ \begin{smallmatrix} \text{Fu} \\ \text{Fu} \end{smallmatrix} \right\} \text{unuse-package}$ $\left\{ \begin{smallmatrix} \text{Fu} \\ \text{Fu} \end{smallmatrix} \right\} \text{other-packages [package-var}^* \text{packages}^* \text{]}$

▷ Make exported symbols of *other-packages* available in *package*, or remove them from *package*, respectively. Return T.

$\left(\begin{smallmatrix} \text{Fu} \\ \text{Fu} \end{smallmatrix} \right) \text{package-use-list package}$

$\left(\begin{smallmatrix} \text{Fu} \\ \text{Fu} \end{smallmatrix} \right) \text{package-used-by-list package}$

▷ List of other packages used by/using *package*.

$\left(\begin{smallmatrix} \text{Fu} \\ \text{Fu} \end{smallmatrix} \right) \text{delete-package package}$

▷ Delete *package*. Return T if successful.

$\text{var}^* \text{package}^* \text{common-lisp-user}$

▷ The current package.

$\left(\begin{smallmatrix} \text{Fu} \\ \text{Fu} \end{smallmatrix} \right) \text{list-all-packages}$

▷ List of registered packages.

$\left(\begin{smallmatrix} \text{Fu} \\ \text{Fu} \end{smallmatrix} \right) \text{package-name package}$

▷ Name of package.

$\left(\begin{smallmatrix} \text{Fu} \\ \text{Fu} \end{smallmatrix} \right) \text{package-nicknames package}$

▷ List of nicknames of *package*.

$\left(\begin{smallmatrix} \text{Fu} \\ \text{Fu} \end{smallmatrix} \right) \text{find-package name}$

▷ Package object with *name* (case-sensitive).

$\left(\begin{smallmatrix} \text{Fu} \\ \text{Fu} \end{smallmatrix} \right) \text{find-all-symbols name}$

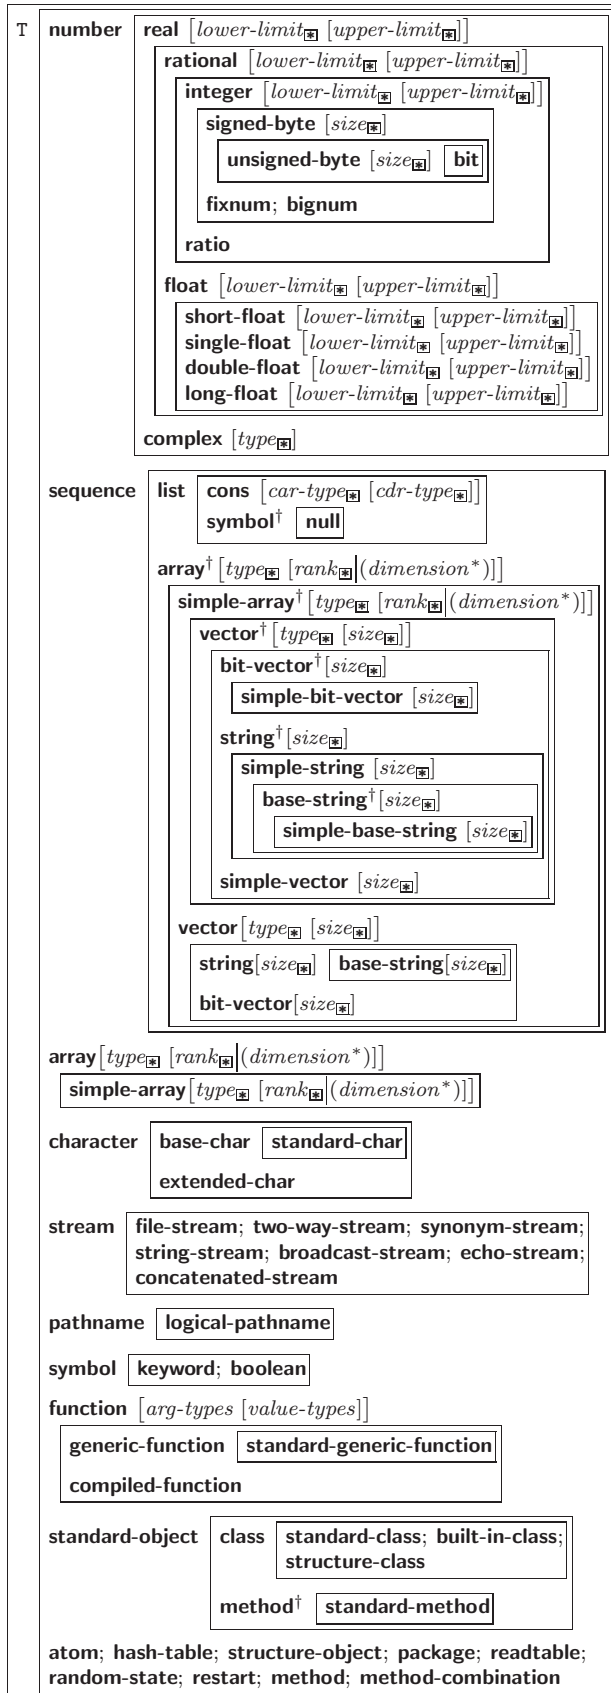

▷ Return list of symbols with *name* from all registered packages.

$\left\{ \begin{smallmatrix} \text{Fu} \\ \text{Fu} \end{smallmatrix} \right\} \text{intern}$ $\left\{ \begin{smallmatrix} \text{Fu} \\ \text{Fu} \end{smallmatrix} \right\} \text{find-symbol}$ $\left\{ \begin{smallmatrix} \text{Fu} \\ \text{Fu} \end{smallmatrix} \right\} \text{foo [package-var}^* \text{packages}^* \text{]}$

▷ Intern or find, respectively, symbol *foo* in *package*. Second return value is one of :internal, :external, or :inherited (or NIL if *intern* created a fresh symbol).

$\left(\begin{smallmatrix} \text{Fu} \\ \text{Fu} \end{smallmatrix} \right) \text{unintern symbol [package-var}^* \text{packages}^* \text{]}$

▷ Remove *symbol* from *package*, return T on success.

[†]For supertypes of this type look for the instance without a [†].

As a type argument, * means no restriction.

Figure 3: Data Types.

$$\left\{ \begin{array}{l} \text{find} \\ \text{find-if} \\ \text{find-if-not} \\ \text{position} \end{array} \right\} \text{foo sequence} \left\{ \begin{array}{l} \text{:from-end bool} \text{NIL} \\ \text{:test test} \text{#'=eq} \\ \text{:test-not test} \\ \text{:start start} \text{0} \\ \text{:end end} \text{NIL} \\ \text{:key function} \end{array} \right\}$$

▷ Return first element in *sequence* which satisfies *test*, or its *position* relative to the begin of *sequence*, respectively.

$$\left\{ \begin{array}{l} \text{find-if} \\ \text{find-if-not} \\ \text{position-if} \\ \text{position-if-not} \end{array} \right\} \text{test sequence} \left\{ \begin{array}{l} \text{:from-end bool} \text{NIL} \\ \text{:start start} \text{0} \\ \text{:end end} \text{NIL} \\ \text{:key function} \end{array} \right\}$$

▷ Return first element in *sequence* which satisfies *test*, or its *position* relative to the begin of *sequence*, respectively.

$$\text{(search sequence-a sequence-b)} \left\{ \begin{array}{l} \text{:from-end bool} \text{NIL} \\ \text{:test function} \text{#'=eq} \\ \text{:test-not function} \\ \text{:start1 start-a} \text{0} \\ \text{:start2 start-b} \text{0} \\ \text{:end1 end-a} \text{NIL} \\ \text{:end2 end-b} \text{NIL} \\ \text{:key function} \end{array} \right\}$$

▷ Search *sequence-b* for a subsequence matching *sequence-a*. Return *position* in *sequence-b*, or *NIL*.

$$\left\{ \begin{array}{l} \text{remove} \\ \text{delete} \end{array} \right\} \text{foo sequence} \left\{ \begin{array}{l} \text{:from-end bool} \text{NIL} \\ \text{:test function} \text{#'=eq} \\ \text{:test-not function} \\ \text{:start start} \text{0} \\ \text{:end end} \text{NIL} \\ \text{:key function} \\ \text{:count count} \text{NIL} \end{array} \right\}$$

▷ Make *copy* of *sequence* without elements matching *foo*.

$$\left\{ \begin{array}{l} \text{remove-if} \\ \text{remove-if-not} \\ \text{delete-if} \\ \text{delete-if-not} \end{array} \right\} \text{test sequence} \left\{ \begin{array}{l} \text{:from-end bool} \text{NIL} \\ \text{:start start} \text{0} \\ \text{:end end} \text{NIL} \\ \text{:key function} \\ \text{:count count} \text{NIL} \end{array} \right\}$$

▷ Make *copy* of *sequence* with all (or *count*) elements satisfying *test* removed.

$$\left\{ \begin{array}{l} \text{remove-duplicates} \\ \text{delete-duplicates} \end{array} \right\} \text{sequence} \left\{ \begin{array}{l} \text{:from-end bool} \text{NIL} \\ \text{:test function} \text{#'=eq} \\ \text{:test-not function} \\ \text{:start start} \text{0} \\ \text{:end end} \text{NIL} \\ \text{:key function} \end{array} \right\}$$

▷ Make *copy* of *sequence* without duplicates.

$$\left\{ \begin{array}{l} \text{substitute} \\ \text{nsubstitute} \end{array} \right\} \text{new old sequence} \left\{ \begin{array}{l} \text{:from-end bool} \text{NIL} \\ \text{:test function} \text{#'=eq} \\ \text{:test-not function} \\ \text{:start start} \text{0} \\ \text{:end end} \text{NIL} \\ \text{:key function} \\ \text{:count count} \text{NIL} \end{array} \right\}$$

▷ Make *copy* of *sequence* with all (or *count*) olds replaced by *new*.

$$\left\{ \begin{array}{l} \text{substitute-if} \\ \text{substitute-if-not} \\ \text{nsubstitute-if} \\ \text{nsubstitute-if-not} \end{array} \right\} \text{new test sequence} \left\{ \begin{array}{l} \text{:from-end bool} \text{NIL} \\ \text{:start start} \text{0} \\ \text{:end end} \text{NIL} \\ \text{:key function} \\ \text{:count count} \text{NIL} \end{array} \right\}$$

▷ Make *copy* of *sequence* with all (or *count*) elements satisfying *test* replaced by *new*.

$$\text{(replace sequence-a sequence-b)} \left\{ \begin{array}{l} \text{:start1 start-a} \text{0} \\ \text{:start2 start-b} \text{0} \\ \text{:end1 end-a} \text{NIL} \\ \text{:end2 end-b} \text{NIL} \end{array} \right\}$$

▷ Replace elements of *sequence-a* with elements of *sequence-b*.

(^{Fu}**map** *type function sequence*⁺)
 ▷ Apply *function* successively to corresponding elements of the *sequences*. Return values as a sequence of *type*. If *type* is NIL, return NIL.

(^{Fu}**map-into** *result-sequence function sequence*^{*})
 ▷ Store into *result-sequence* successively values of *function* applied to corresponding elements of the *sequences*.

(^{Fu}**reduce** *function sequence* $\left\{ \begin{array}{l} \text{:initial-value } \text{foo}_{\text{NIL}} \\ \text{:from-end } \text{bool}_{\text{NIL}} \\ \text{:start } \text{start}_{\text{0}} \\ \text{:end } \text{end}_{\text{NIL}} \\ \text{:key } \text{function} \end{array} \right\}$)

▷ Starting with the first two elements of *sequence*, apply *function* successively to its last return value together with the next element of *sequence*. Return last value of function.

(^{Fu}**copy-seq** *sequence*)
 ▷ Return copy of sequence with shared elements.

7 Hash Tables

Key-value storage similar to hash tables can as well be achieved using association lists and property lists; see pages 9 and 16.

(^{Fu}**hash-table-p** *foo*) ▷ Return T if *foo* is of type **hash-table**.

(^{Fu}**make-hash-table** $\left\{ \begin{array}{l} \text{:test } \{\text{eq|eq|equal|equal}\}_{\text{NIL}} \\ \text{:size } \text{int} \\ \text{:rehash-size } \text{num} \\ \text{:rehash-threshold } \text{num} \end{array} \right\}$)

▷ Make a hash table.

(^{Fu}**gethash** *key hash-table* [*default*_{NIL}])
 ▷ Return object with *key* if any or default otherwise; and T if found, NIL otherwise. settable.

(^{Fu}**hash-table-count** *hash-table*)
 ▷ Number of entries in *hash-table*.

(^{Fu}**remhash** *key hash-table*)
 ▷ Remove from *hash-table* entry with *key* and return T if it existed. Return NIL otherwise.

(^{Fu}**clrhsh** *hash-table*) ▷ Empty hash-table.

(^{Fu}**maphash** *function hash-table*)
 ▷ Iterate over *hash-table* calling *function* on key and value. Return NIL.

(^M**with-hash-table-iterator** (*foo hash-table*) (**declare** $\widehat{\text{decl}}^*$)^{*} *form*^{P*})
 ▷ Return values of *forms*. In *forms*, invocations of (*foo*) return: T if an entry is returned; its key; its value.

(^{Fu}**hash-table-test** *hash-table*)
 ▷ Test function used in *hash-table*.

(^{Fu}**hash-table-size** *hash-table*)
 (^{Fu}**hash-table-rehash-size** *hash-table*)
 (^{Fu}**hash-table-rehash-threshold** *hash-table*)
 ▷ Current size, rehash-size, or rehash-threshold, respectively, as used in **make-hash-table**.

(^{Fu}**sxhash** *foo*)
 ▷ Hash code unique for any argument ^{Fu}**equal** *foo*.

(^M**with-open-file** (*stream path open-arg*^{*}) (**declare** $\widehat{\text{decl}}^*$)^{*} *form*^{P*})
 ▷ Use **open** with *open-args* (cf. page 36) to temporarily create *stream* to *path*; return values of forms.

(^{Fu}**user-homedir-pathname** [*host*]) ▷ User's home directory.

13 Types and Classes

For any class, there is always a corresponding type of the same name.

(^{Fu}**typep** *foo type* [*environment*_{NIL}])
 ▷ Return T if *foo* is of *type*.

(^{Fu}**subtypep** *type-a type-b* [*environment*])
 ▷ Return T if *type-a* is a recognizable subtype of *type-b*, and NIL if the relationship could not be determined.

(⁰**the** *type form*)
 ▷ Return values of *form* which are declared to be of *type*.

(^{Fu}**coerce** *object type*) ▷ Coerce *object* into *type*.

(^M**typecase** *foo* (*type a-form*^{P*})^{*} [$\left\{ \begin{array}{l} \text{otherwise} \\ \text{T} \end{array} \right\} \text{b-form}_{\text{NIL}}^{\text{P*}}$])
 ▷ Return values of the *a-forms* whose *type* is *foo* of. Return values of b-forms if no *type* matches.

($\left\{ \begin{array}{l} \text{ctypecase} \\ \text{etypecase} \end{array} \right\}$ ^M**typecase** *foo* (*type form*^{P*})^{*})
 ▷ Return values of the forms whose *type* is *foo* of. Signal correctable/non-correctable error, respectively if no *type* matches.

(^{Fu}**type-of** *foo*) ▷ Type of foo.

(**check-type** *place type* [*string*])
 ▷ Return NIL and signal correctable **type-error** if *place* is not of *type*.

(^{Fu}**stream-element-type** *stream*) ▷ Return type of *stream* objects.

(^{Fu}**array-element-type** *array*) ▷ Element type *array* can hold.

(^{Fu}**upgraded-array-element-type** *type* [*environment*_{NIL}])
 ▷ Element type of most specialized array capable of holding elements of *type*.

(^M**deftype** *foo* (*macro-λ*^{*}) (**declare** $\widehat{\text{decl}}^*$)^{*} [*doc*] *form*^{P*})
 ▷ Define type *foo* which when referenced as (*foo arg*^{*}) applies expanded *forms* to *args* returning the new type. For (*macro-λ*^{*}) see p. 18 but with default value of ***** instead of NIL. *forms* are enclosed in an implicit **block** *foo*.

(**eq** *foo*)
 (**member** *foo*^{*}) ▷ Specifier for a type comprising *foo* or *foos*.

(**satisfies** *predicate*)
 ▷ Type specifier for all objects satisfying *predicate*.

(**mod** *n*) ▷ Type specifier for all non-negative integers < *n*.

(**not** *type*) ▷ Complement of type.

(**and** *type*^{*}_{NIL}) ▷ Type specifier for intersection of *types*.

(**or** *type*^{*}_{NIL}) ▷ Type specifier for union of *types*.

(**values** *type*^{*} [**&optional** *type*^{*} **&rest** *other-args*])
 ▷ Type specifier for multiple values.

9.2 Variables

$\left\{ \begin{array}{l} \text{defconstant} \\ \text{defparameter} \end{array} \right\} \widehat{foo} \text{ form } [\widehat{doc}]$

▷ Assign value of *form* to global constant/dynamic variable *foo*.

$\text{(defvar } \widehat{foo} [\text{form } [\widehat{doc}]])$

▷ Unless bound already, assign value of *form* to dynamic variable *foo*.

$\left\{ \begin{array}{l} \text{setf} \\ \text{psetf} \end{array} \right\} \{ \text{place form} \}^*$

▷ Set *places* to primary values of *forms*. Return values of last form/NIL; work sequentially/in parallel, respectively.

$\left\{ \begin{array}{l} \text{setq} \\ \text{psetq} \end{array} \right\} \{ \text{symbol form} \}^*$

▷ Set *symbols* to primary values of *forms*. Return value of last form/NIL; work sequentially/in parallel, respectively.

$\text{(set } \widehat{\text{symbol}} \text{ } \widehat{foo})$

▷ Set *symbol*'s value cell to *foo*. Deprecated.

$\text{(multiple-value-setq vars form)}$

▷ Set elements of *vars* to the values of *form*. Return form's primary value.

$\text{(shiftf } \widehat{\text{place}}^+ \text{ } \widehat{foo})$

▷ Store value of *foo* in rightmost *place* shifting values of *places* left, returning first place.

$\text{(rotatef } \widehat{\text{place}}^*)$

▷ Rotate values of *places* left, old first becoming new last *place*'s value. Return NIL.

$\text{(makunbound } \widehat{foo})$

▷ Delete special variable *foo* if any.

$\text{(get } \widehat{\text{symbol}} \text{ } \widehat{\text{key}} [\text{default } \text{NIL}])$

$\text{(getf } \widehat{\text{place}} \text{ } \widehat{\text{key}} [\text{default } \text{NIL}])$

▷ First entry *key* from property list stored in *symbol*/in *place*, respectively, or *default* if there is no *key*. setfable.

$\text{(get-properties } \widehat{\text{property-list}} \text{ } \widehat{\text{keys}})$

▷ Return key and value of first entry from *property-list* matching a key from *keys*, and tail of *property-list* starting with that key. Return NIL, NIL, and NIL if there was no matching key in *property-list*.

$\text{(remprop } \widehat{\text{symbol}} \text{ } \widehat{\text{key}})$

$\text{(remf } \widehat{\text{place}} \text{ } \widehat{\text{key}})$

▷ Remove first entry *key* from property list stored in *symbol*/in *place*, respectively. Return T if *key* was there, or NIL otherwise.

9.3 Functions

Below, ordinary lambda list (*ord-λ*^{*}) has the form

$(\text{var}^* [\&\text{optional} \left\{ \begin{array}{l} \text{var} \\ \text{init } \text{NIL} \end{array} \right\} [\text{supplied-p}]]^*) [\&\text{rest var}]$
 $[\&\text{key} \left\{ \begin{array}{l} \text{var} \\ \text{key } \text{var} \end{array} \right\} [\text{init } \text{NIL} [\text{supplied-p}]]^*]$
 $[\&\text{allow-other-keys}] [\&\text{aux} \left\{ \begin{array}{l} \text{var} \\ \text{init } \text{NIL} \end{array} \right\}^*]).$

supplied-p is T if there is a corresponding argument. *init* forms can refer to any *init* and *supplied-p* to their left.

$\left\{ \begin{array}{l} \text{defun} \\ \text{lambda} \end{array} \right\} \left\{ \begin{array}{l} \text{foo } (\text{ord-}\lambda^*) \\ (\text{setf } \text{foo}) (\text{new-value ord-}\lambda^*) \end{array} \right\} (\text{declare } \widehat{\text{decl}}^*)^* [\widehat{\text{doc}}]$

▷ Define a function named *foo* or (*setf foo*), or an anonymous function, respectively, which applies *forms* to *ord-λs*. For *defun*, *forms* are enclosed in an implicit **block** *foo*.

$\text{(get-output-stream-string } \widehat{\text{string-stream}})$

▷ Clear and return as a string characters on *string-stream*.

$\text{(listen } [\text{stream } \text{var } \text{*standard-input*}])$

▷ T if there is a character in input *stream*.

$\text{(clear-input } [\text{stream } \text{var } \text{*standard-input*}])$

▷ Clear input from *stream*, return NIL.

$\left\{ \begin{array}{l} \text{clear-output} \\ \text{force-output} \\ \text{finish-output} \end{array} \right\} [\text{stream } \text{var } \text{*standard-output*}])$

▷ End output to *stream* and return NIL immediately, after initiating flushing of buffers, or after flushing of buffers, respectively.

$\text{(close } \widehat{\text{stream}} [\text{:abort } \text{bool } \text{NIL}])$

▷ Close *stream*. Return T if *stream* had been open. If *:abort* is T, delete associated file.

$\text{(with-open-stream (foo } \widehat{\text{stream}}) (\text{declare } \widehat{\text{decl}}^*)^* \text{form}^{\text{P}_k})$

▷ Evaluate *forms* with *foo* locally bound to *stream*. Return values of forms.

$\text{(with-input-from-string (foo } \text{string } \left\{ \begin{array}{l} \text{:index } \widehat{\text{index}} \\ \text{:start } \text{start}_0 \\ \text{:end } \text{end } \text{NIL} \end{array} \right\}) (\text{declare } \widehat{\text{decl}}^*)^* \text{form}^{\text{P}_k})$

▷ Evaluate *forms* with *foo* locally bound to input **string-stream** from *string*. Return values of forms; store next reading position into *index*.

$\text{(with-output-to-string (foo } [\text{string } \text{NIL}] [\text{:element-type } \text{type } \text{character}]) (\text{declare } \widehat{\text{decl}}^*)^* \text{form}^{\text{P}_k})$

▷ Evaluate *forms* with *foo* locally bound to an output **string-stream**. Append output to *string* and return values of forms if *string* is given. Return string containing output otherwise.

$\text{(stream-external-format } \widehat{\text{stream}})$

▷ External file format designator.

terminal-io

▷ Bidirectional stream to user terminal.

standard-input

standard-output

error-output

▷ Standard input stream, standard output stream, or standard error output stream, respectively.

debug-io

query-io

▷ Bidirectional streams for debugging and user interaction.

12.7 Files

$\text{(make-pathname } \left\{ \begin{array}{l} \text{:host } \text{host} \\ \text{:device } \text{dev} \\ \text{:directory } \text{dir} \\ \text{:name } \text{name} \\ \text{:type } \text{type} \\ \text{:version } \text{ver} \\ \text{:defaults } \text{path} \\ \text{:case } \{ \text{:local} | \text{:common} \} \text{:local} \} \end{array} \right\})$

▷ Construct pathname.

$\text{(merge-pathnames } \widehat{\text{pathname}})$

$[\text{default-pathname } \text{var } \text{*default-pathname-defaults*}]$

$[\text{default-version } \text{newest}])$

▷ Return pathname after filling in missing parts from defaults.

$\text{*default-pathname-defaults*}$

▷ Pathname to use if one is needed and none supplied.

$\text{(pathname } \widehat{\text{path}})$

▷ Pathname of *path*.

▷ **Conditional Expression.** The *texts* are format control subclauses the zero-indexed argument (or the *i*th if given) of which is chosen. With **:**, the argument is boolean and takes first *text* for NIL and second *text* for T. With **@**, the argument is boolean and if T, takes the only *text* and remains to be read; no *text* is chosen and the argument is used up if it is NIL.

~[**@**?

▷ **Recursive Processing.** Process two arguments as **format** string and argument list. With **@**, take one argument as **format** string and use then the rest of the original arguments.

~[*prefix*{, *prefix*}*][**:**][**@**]/*function*/

▷ **Call Function.** Call *function* with the arguments stream, format-argument, colon-p, at-sign-p and *prefixes* for printing format-argument.

~[**:**][**@**W

▷ **Write.** Print argument of any type obeying every printer control variable. With **:**, pretty-print. With **@**, print without limits on length or depth.

{**V**|#}

▷ In place of the comma-separated prefix parameters: use next argument or number of remaining unprocessed arguments, respectively.

12.6 Streams

(^{Fu}open *path* {
 :direction {
 :input
 :output
 :io {
 :probe
 :character
 }
 }
 :element-type *type*
 :if-exists {
 :new-version
 :error
 :rename
 :rename-and-delete
 :overwrite
 :append
 :supersede
 NIL
 }
 :if-does-not-exist {
 :create
 NIL
 }
 :external-format *format* {
 :default
 }
 })

▷ Open **file-stream** to *path*.

(^{Fu}make-concatenated-stream *input-stream**)
 (^{Fu}make-broadcast-stream *output-stream**)
 (^{Fu}make-two-way-stream *input-stream-part* *output-stream-part*)
 (^{Fu}make-echo-stream *from-input-stream* *to-output-stream*)
 (^{Fu}make-synonym-stream *variable-bound-to-stream*)
 ▷ Return **stream** of indicated type.

(^{Fu}make-string-input-stream *string* [*start*₀ [*end*_{NIL}]])
 ▷ Return a **string-stream** supplying the characters from *string*.

(^{Fu}make-string-output-stream [*element-type* *type*_{character}])
 ▷ Return a **string-stream** accepting characters (available via **get-output-stream-string**).

(^{Fu}concatenated-stream-streams *concatenated-stream*)
 (^{Fu}broadcast-stream-streams *broadcast-stream*)
 ▷ Return list of streams *concatenated-stream* still has to read from/*broadcast-stream* is broadcasting to.

(^{Fu}two-way-stream-input-stream *two-way-stream*)
 (^{Fu}two-way-stream-output-stream *two-way-stream*)
 (^{Fu}echo-stream-input-stream *echo-stream*)
 (^{Fu}echo-stream-output-stream *echo-stream*)
 ▷ Return source **stream** or sink **stream** of *two-way-stream*/*echo-stream*, respectively.

(^{Fu}synonym-stream-symbol *synonym-stream*)
 ▷ Return **symbol** of *synonym-stream*.

(^{Fu}let {
 (^{so}labels {
 (^{so}foo (ord-λ*))
 (^{so}setf *foo* (*new-value* ord-λ*))
 })
 (^{so}declare *local-decl**)*)
 })
 [*doc*] *local-form*_R*) (^{so}declare *decl**)* *form*_R*)
 ▷ Evaluate *forms* with locally defined functions *foo*. Globally defined functions of the same name are shadowed. Each *foo* is also the name of an implicit **block** around its corresponding *local-form**. Only for **labels**, functions *foo* are visible inside *local-forms*. Return values of forms.

(^{so}function {
 (^{so}foo
 (^{so}lambda *form**)*)
 })
 ▷ Return lexically innermost **function** named *foo* or a lexical closure of the **lambda** expression.

(^{Fu}apply {
 (^{so}function
 (^{so}setf *function*))
 } *arg**)
 ▷ Return values of function called on *args*. Last *arg* must be a list. **setfable** if *function* is one of **aref**, **bit**, and **sbit**.

(^{Fu}funcall *function* *arg**)
 ▷ Return values of function called with *args*.

(^{so}multiple-value-call *foo* *form**)
 ▷ Call function *foo* with all the values of each *form* as its arguments. Return values returned by foo.

(^{Fu}values-list *list*) ▷ Return elements of list.

(^{Fu}values *foo**)
 ▷ Return as multiple values the primary values of the *foos*. **setfable**.

(^{Fu}multiple-value-list *form*)
 ▷ Return in a list values of *form*.

(^Mnth-value *n* *form*)
 ▷ Zero-indexed *n*th return value of *form*.

(^{Fu}complement *function*)
 ▷ Return new function with same arguments and same side effects as *function*, but with complementary truth value.

(^{Fu}constantly *foo*)
 ▷ Return function of any number of arguments returning *foo*.

(^{Fu}identity *foo*) ▷ Return *foo*.

(^{Fu}function-lambda-expression *function*)
 ▷ If available, return lambda expression of *function*, **NIL** if *function* was defined in an environment without bindings, and name of *function*.

(^{Fu}definition {
 (^{so}foo
 (^{so}setf *foo*))
 })
 ▷ Definition of global function *foo*. **setfable**.

(^{Fu}makunbound *foo*)
 ▷ Remove global function or macro definition *foo*.

^{co}call-arguments-limit
^{co}lambda-parameters-limit
 ▷ Upper bound of the number of function arguments or lambda list parameters, respectively; ≥ 50 .

^{co}multiple-values-limit
 ▷ Upper bound of the number of values a multiple value can have; ≥ 20 .

9.4 Macros

Below, macro lambda list (*macro-λ**) has the form of either

$([\&\text{whole } \text{var}] [E] \left\{ \begin{array}{c} \text{var} \\ (\text{macro-}\lambda^*) \end{array} \right\}^* [E])$

$[\&\text{optional} \left\{ \left\{ \begin{array}{c} \text{var} \\ (\text{macro-}\lambda^*) \end{array} \right\} [init_{\text{NUL}} [supplied-p]] \right\}^*] [E]$

$[\&\text{rest} \left\{ \begin{array}{c} \text{var} \\ (\text{macro-}\lambda^*) \end{array} \right\}] [E]$

$[\&\text{body} \left\{ \begin{array}{c} \text{var} \\ (\text{macro-}\lambda^*) \end{array} \right\}] [E]$

$[\&\text{key} \left\{ \left\{ \begin{array}{c} \text{var} \\ (:key \left\{ \begin{array}{c} \text{var} \\ (\text{macro-}\lambda^*) \end{array} \right\}) \end{array} \right\} [init_{\text{NUL}} [supplied-p]] \right\}^*] [E]$

$[\&\text{allow-other-keys}] [\&\text{aux} \left\{ \begin{array}{c} \text{var} \\ (\text{var} [init_{\text{NUL}}]) \end{array} \right\}^*] [E])$

or $([\&\text{whole } \text{var}] [E] \left\{ \begin{array}{c} \text{var} \\ (\text{macro-}\lambda^*) \end{array} \right\}^* [E])$

$[\&\text{optional} \left\{ \left\{ \begin{array}{c} \text{var} \\ (\text{macro-}\lambda^*) \end{array} \right\} [init_{\text{NUL}} [supplied-p]] \right\}^*] [E] . \text{var}).$

One toplevel $[E]$ may be replaced by $\&\text{environment } \text{var}$. *supplied-p* is T if there is a corresponding argument. *init* forms can refer to any *init* and *supplied-p* to their left.

$(\overset{\text{M}}{\text{defmacro}} \left\{ \begin{array}{c} \text{foo} \\ (\text{setf } \text{foo}) \end{array} \right\} (\text{macro-}\lambda^*) (\text{declare } \widehat{\text{decl}}^* \text{ } \widehat{\text{doc}} \text{ } \text{form}^{\text{P}}_*)$
 \triangleright Define macro *foo* which on evaluation as (*foo tree*) applies expanded *forms* to arguments from *tree*, which corresponds to *tree*-shaped *macro-λs*. *forms* are enclosed in an implicit **block** *foo*.

$(\overset{\text{M}}{\text{define-symbol-macro}} \text{foo } \text{form})$
 \triangleright Define symbol macro *foo* which on evaluation evaluates expanded *form*.

$(\overset{\text{SO}}{\text{macrolet}} ((\text{foo } (\text{macro-}\lambda^*) (\text{declare } \widehat{\text{local-decl}}^*) \text{ } \widehat{\text{doc}} \text{ } \text{macro-form}^{\text{P}}_*)) (\text{declare } \widehat{\text{decl}}^*) \text{ } \text{form}^{\text{P}}_*)$
 \triangleright Evaluate *forms* with locally defined mutually invisible macros *foo* which are enclosed in implicit **blocks** of the same name.

$(\overset{\text{SO}}{\text{symbol-macrolet}} ((\text{foo } \text{expansion-form})^*) (\text{declare } \widehat{\text{decl}}^*) \text{ } \text{form}^{\text{P}}_*)$
 \triangleright Evaluate *forms* with locally defined symbol macros *foo*.

$(\overset{\text{M}}{\text{defsetf}} \text{function } \left\{ \begin{array}{c} \widehat{\text{updater}} \text{ } \widehat{\text{doc}} \\ (\text{setf-}\lambda^*) (\text{s-var}^*) (\text{declare } \widehat{\text{decl}}^*) \text{ } \widehat{\text{doc}} \text{ } \text{form}^{\text{P}}_* \end{array} \right\})$
 where *defsetf* lambda list (*setf-λ**) has the form
 $(\text{var}^* [\&\text{optional} \left\{ \begin{array}{c} \text{var} \\ (\text{var} [init_{\text{NUL}} [supplied-p]]) \end{array} \right\}^*]$
 $[\&\text{rest } \text{var}] [\&\text{key} \left\{ \left\{ \begin{array}{c} \text{var} \\ (:key \text{ } \text{var}) \end{array} \right\} [init_{\text{NUL}} [supplied-p]] \right\}^*]$
 $[\&\text{allow-other-keys}] [\&\text{environment } \text{var}])$
 \triangleright Specify how to **setf** a place accessed by *function*. **Short form:** (**setf** (*function arg**) *value-form*) is replaced by (*updater arg* value-form*); the latter must return *value-form*. **Long form:** on invocation of (**setf** (*function arg**) *value-form*), *forms* must expand into code that sets the place accessed where *setf-λ* and *s-var** describe the arguments of *function* and the value(s) to be stored, respectively; and that returns the value(s) of *s-var**. *forms* are enclosed in an implicit **block** named *function*.

$(\overset{\text{M}}{\text{define-setf-expander}} \text{function } (\text{macro-}\lambda^*) (\text{declare } \widehat{\text{decl}}^*) \text{ } \widehat{\text{doc}} \text{ } \text{form}^{\text{P}}_*)$
 \triangleright Specify how to **setf** a place accessed by *function*. On invocation of (**setf** (*function arg**) *value-form*), *form** must expand into code returning *arg-vars*, *args*, *newval-vars*, *set-form*, and *get-form* as described with **get-setf-expansion** where the elements of macro lambda list *macro-λ** are bound to corresponding *args*. *forms* are enclosed in an implicit **block** *function*.

$\sim[\text{dec-digits}_{\text{D}}] [\text{int-digits}_{\text{D}}] [\text{width}_{\text{D}}] [\text{pad-char}_{\text{C}}]]$
 $[:][\text{O}]\$$
 \triangleright **Monetary Floating-Point.** Print argument as fixed-format floating-point number. With $:$, put sign before any padding; with **O**, always prepend a sign.

$\{\sim\text{C}|\sim\text{C}|\sim\text{OC}|\sim\text{OC}\}$
 \triangleright **Character.** Print, spell out, print in $\#\backslash$ syntax, or tell how to type, respectively, argument as (possibly non-printing) character.

$\{\sim(\text{text}\sim)|\sim:(\text{text}\sim)|\sim\text{O}(\text{text}\sim)|\sim\text{O}(\text{text}\sim)\}$
 \triangleright **Case-Conversion.** Convert *text* to lowercase, convert first letter of each word to uppercase, capitalize first word and convert the rest to lowercase, or convert to uppercase, respectively.

$\{\sim\text{P}|\sim\text{P}|\sim\text{OP}|\sim\text{OP}\}$
 \triangleright **Plural.** If argument *eq1* print nothing, otherwise print *s*; do the same for the previous argument; if argument *eq1* print *y*, otherwise print *ies*; do the same for the previous argument, respectively.

$\sim[n_{\text{D}}]\%$ \triangleright **Newline.** Print *n* newlines.

$\sim[n_{\text{D}}]\&$
 \triangleright **Fresh-Line.** Print *n* – 1 newlines if output stream is at the beginning of a line, or *n* newlines otherwise.

$\{\sim|:\sim|:\sim\text{O}|\sim\text{O}|\}$
 \triangleright **Conditional Newline.** Print a newline like **pprint-newline** with argument *:linear*, *:fill*, *:miser*, or *:mandatory*, respectively.

$\sim[:][\text{O}]\leftarrow$
 \triangleright **Ignored Newline.** Ignore newline and following whitespace. With $:$, ignore only newline; with **O**, ignore only following whitespace.

$\sim[n_{\text{D}}]||$ \triangleright **Page.** Print *n* page separators.

$\sim[n_{\text{D}}]\sim$ \triangleright **Tilde.** Print *n* tildes.

$\sim[\text{min-col}_{\text{D}}] [\text{col-inc}_{\text{D}}] [\text{min-pad}_{\text{D}}] [\text{pad-char}_{\text{C}}]]$
 $[:][\text{O}]< [\text{nl-text}\sim[\text{spare}_{\text{D}}[\text{width}]]:] \{ \text{text}\sim; \}^* \text{text} \sim>$
 \triangleright **Justification.** Justify text produced by *texts* in a field of at least *min-col* columns. With $:$, right justify; with **O**, left justify. If this would leave less than *spare* characters on the current line, output *nl-text* first.

$\sim[:][\text{O}]< [\{ \text{prefix}_{\text{C}}\sim; \}] \{ \text{per-line-prefix}\sim\text{O}; \}$
 $\text{body } [\sim; \text{suffix}_{\text{C}}\sim:] \sim[:][\text{O}]\>$
 \triangleright **Logical Block.** Act like **pprint-logical-block** using *body* as *format* control string on the elements of the list argument or, with **O**, on the remaining arguments, which are extracted by **pprint-pop**. With $:$, *prefix* and *suffix* default to (and). When closed by $\sim[:][\text{O}]\>$, spaces in *body* are replaced with conditional newlines.

$\{\sim[n_{\text{D}}]|\sim[n_{\text{D}}]:i\}$
 \triangleright **Indent.** Set indentation to *n* relative to leftmost/to current position.

$\sim[\text{c}_{\text{D}}] [\text{i}_{\text{D}}] [:][\text{O}]\text{T}$
 \triangleright **Tabulate.** Move cursor forward to column number $c+ki$, $k \geq 0$ being as small as possible. With $:$, calculate column numbers relative to the immediately enclosing section. With **O**, move to column number $c_0 + c + ki$ where c_0 is the current position.

$\{\sim[m_{\text{D}}]*|\sim[m_{\text{D}}]:*|\sim[n_{\text{D}}]\text{O}*\}$
 \triangleright **Go-To.** Jump *m* arguments forward, or backward, or to argument *n*.

$\sim[\text{limit}][:][\text{O}]\{ \text{text}\sim \}$
 \triangleright **Iteration.** *text* is used repeatedly, up to *limit*, as control string for the elements of the list argument or (with **O**) for the remaining arguments. With $:$ or **O**, list elements or remaining arguments should be lists of which a new one is used at each iteration step.

$\sim[x [\text{y } [z]]]^\wedge$
 \triangleright **Escape Upward.** Leave immediately $\sim<\sim>$, $\sim<\sim>$, $\sim\{ \sim \}$, $\sim?$, or the entire **format** operation. With one to three prefixes, act only if $x = 0$, $x = y$, or $x \leq y \leq z$, respectively.

$\sim[z][:][\text{O}][\{ \text{text}\sim; \}^* \text{text} \sim; \} \sim[:][\text{O}]\sim]$

print-pretty \triangleright If T, print pretty.

print-radix_{NIL} \triangleright If T, print rationals with a radix indicator.

print-readably_{NIL} \triangleright If T, print **readably** or signal error **print-not-readable**.

print-right-margin_{NIL} \triangleright Right margin width in ems while pretty-printing.

(set-pprint-dispatch *type function* [*priority*])
 [*table* ***print-pprint-dispatch***])
 \triangleright Install entry comprising *function* of arguments stream and object to print; and *priority* as *type* into *table*. If *function* is NIL, remove *type* from *table*. Return **NIL**.

(pprint-dispatch *foo* [*table* ***print-pprint-dispatch***])
 \triangleright Return highest priority *function* associated with type of *foo* and T if there was a matching type specifier in *table*.

(copy-pprint-dispatch [*table* ***print-pprint-dispatch***])
 \triangleright Return copy of *table* or, if *table* is NIL, initial value of ***print-pprint-dispatch***.

print-pprint-dispatch \triangleright Current pretty print dispatch table.

12.5 Format

(formatter *control*)
 \triangleright Return *function* of stream and a **&rest** argument applying **format** to stream, *control*, and the **&rest** argument returning NIL or any excess arguments.

(format {T|NIL|*out-string*|*out-stream*} *control* *arg**)
 \triangleright Output string *control* which may contain ~ directives possibly taking some *args*. Alternatively, *control* can be a function returned by **formatter** which is then applied to *out-stream* and *arg**. Output to *out-string*, *out-stream* or, if first argument is T, to ***standard-output***. Return **NIL**. If first argument is NIL, return *formatted output*.

~[*min-col*] [*col-inc*] [*min-pad*] [*pad-char*]]
 [:]@{A|S}
 \triangleright **Aesthetic/Standard**. Print argument of any type for consumption by humans/by the reader, respectively. With :, print NIL as () rather than nil; with @, add *pad-chars* on the left rather than on the right.

~[*radix*] [*width*] [*pad-char*] [, [*comma-char*] [*comma-interval*]] [:]@R
 \triangleright **Radix**. (With one or more prefix arguments.) Print argument as number; with :, group digits *comma-interval* each; with @, always prepend a sign.

{~R|~R|~@R|~@R}
 \triangleright **Roman**. Take argument as number and print it as English cardinal number, as English ordinal number, as Roman numeral, or as old Roman numeral, respectively.

~[*width*] [*pad-char*] [, [*comma-char*] [*comma-interval*]] [:]@{D|B|O|X}
 \triangleright **Decimal/Binary/Octal/Hexadecimal**. Print integer argument as number. With : group digits *comma-interval* each; with @, always prepend a sign.

~[*width*] [*dec-digits*] [*shift*] [, [*overflow-char*] [*pad-char*]]] @F
 \triangleright **Fixed-Format Floating-Point**. With @, always prepend a sign.

~[*width*] [*int-digits*] [*exp-digits*] [, [*scale-factor*] [*overflow-char*] [*pad-char*] [*exp-char*]]] @{E|G}
 \triangleright **Exponential/General Floating-Point**. Print argument as floating-point number with *int-digits* before decimal point and *exp-digits* in the signed exponent. With ~G, choose either ~E or ~F. With @, always prepend a sign.

(get-setf-expansion *place* [*environment*])
 \triangleright Return lists of temporary variables *arg-vars* and of corresponding *args* as given with *place*, list *newval-vars* with temporary variables corresponding to the new values, and *set-form* and *get-form* specifying in terms of *arg-vars* and *newval-vars* how to **setf** and how to read *place*.

(define-modify-macro *foo* ([**&optional** *var* (*init* [*supplied-p*])]) [**&rest** *var*]) *function* [*doc*])
 \triangleright Define macro *foo* able to modify a place. On invocation of (*foo place arg**), the value of *function* applied to *place* and *args* will be stored into *place* and returned.

lambda-list-keywords

\triangleright List of macro lambda list keywords. These are at least:

&whole *var*
 \triangleright Bind *var* to the entire macro call form.

&optional *var**
 \triangleright Bind *vars* to corresponding arguments if any.

{&rest &body} *var*
 \triangleright Bind *var* to a list of remaining arguments.

&key *var**
 \triangleright Bind *vars* to corresponding keyword arguments.

&allow-other-keys
 \triangleright Suppress keyword argument checking. Callers can do so using **:allow-other-keys** T.

&environment *var*
 \triangleright Bind *var* to the lexical compilation environment.

&aux *var** \triangleright Bind *vars* as in **let***.

9.5 Control Flow

(if *test* *then* [*else*])
 \triangleright Return values of *then* if *test* returns T; return values of *else* otherwise.

(cond (*test* *then** [*test*])*)
 \triangleright Return the values of the first *then** whose *test* returns T; return **NIL** if all *tests* return NIL.

{when unless} *test* *foo**
 \triangleright Evaluate *foos* and return their values if *test* returns T or NIL, respectively. Return **NIL** otherwise.

(case *test* (*key**) *foo** [*otherwise*] *bar**)
 \triangleright Return the values of the first *foo** one of whose *keys* is **eq** *test*. Return values of *bars* if there is no matching *key*.

{ecase ccase} *test* (*key**) *foo**
 \triangleright Return the values of the first *foo** one of whose *keys* is **eq** *test*. Signal non-correctable/correctable **type-error** and return **NIL** if there is no matching *key*.

(and *form**)
 \triangleright Evaluate *forms* from left to right. Immediately return **NIL** if one *form*'s value is NIL. Return values of last *form* otherwise.

(or *form**)
 \triangleright Evaluate *forms* from left to right. Immediately return *primary value* of first non-NIL-evaluating form, or all values if last *form* is reached. Return **NIL** if no *form* returns T.

(progn *form**)
 \triangleright Evaluate *forms* sequentially. Return values of last *form*.

(multiple-value-prog1 *form-r form**)
 \triangleright Evaluate *forms* in order. Return values/1st value, respectively, of *form-r*.

$\{\overset{\text{so}}{\text{let}}^*\}$ $\left(\left\{\left\{\text{name}\right.\right\}^* \left(\text{declare } \widehat{\text{decl}}^*\right)^* \text{form}^{\text{P}}\right)$
 ▷ Evaluate *forms* with *names* lexically bound (in parallel or sequentially, respectively) to *values*. Return values of forms.

$\{\overset{\text{M}}{\text{prog}}^*\}$ $\left(\left\{\left\{\text{var}\right.\right\}^* \left(\text{declare } \widehat{\text{decl}}^*\right)^* \left\{\widehat{\text{tag}}\right.\right\}^* \left\{\widehat{\text{form}}\right.\right\}^*\right)$
 ▷ Evaluate *tagbody*-like body with *vars* locally bound (in parallel or sequentially, respectively) to *values*. Return NIL or explicitly returned values. Implicitly, the whole form is a *block* named *NIL*.

$\{\overset{\text{so}}{\text{progv}}\}$ *symbols values form*^P
 ▷ Evaluate *forms* with locally established dynamic bindings of *symbols* to *values* or *NIL*. Return values of forms.

$\{\overset{\text{so}}{\text{unwind-protect}}\}$ *protected cleanup*^{*}
 ▷ Evaluate *protected* and then, no matter how control leaves *protected*, *cleanups*. Return values of protected.

$\{\overset{\text{M}}{\text{destructuring-bind}}\}$ *destruct-λ bar (declare decl)* form*^P
 ▷ Evaluate *forms* with variables from tree *destruct-λ* bound to corresponding elements of tree *bar*, and return their values. *destruct-λ* resembles *macro-λ* (section 9.4), but without any *&environment* clause.

$\{\overset{\text{M}}{\text{multiple-value-bind}}\}$ $\left(\widehat{\text{var}}^* \text{values-form} \left(\text{declare } \widehat{\text{decl}}^*\right)^* \text{body-form}^{\text{P}}\right)$
 ▷ Evaluate *body-forms* with *vars* lexically bound to the return values of *values-form*. Return values of body-forms.

$\{\overset{\text{so}}{\text{block}}\}$ *name form*^P
 ▷ Evaluate *forms* in a lexical environment, and return their values unless interrupted by *return-from*.

$\{\overset{\text{so}}{\text{return-from}}\}$ *foo [result]*_{NIL}
 $\{\overset{\text{M}}{\text{return}}\}$ *[result]*_{NIL}
 ▷ Have nearest enclosing *block* named *foo*/named *NIL*, respectively, return with values of *result*.

$\{\overset{\text{so}}{\text{tagbody}}\}$ $\{\widehat{\text{tag}}\text{form}\}^*$
 ▷ Evaluate *forms* in a lexical environment. *tags* (symbols or integers) have lexical scope and dynamic extent, and are targets for *go*. Return NIL.

$\{\overset{\text{so}}{\text{go}}\}$ *tag*
 ▷ Within the innermost enclosing *tagbody*, jump to a tag *eql tag*.

$\{\overset{\text{so}}{\text{catch}}\}$ *tag form*^P
 ▷ Evaluate *forms* and return their values unless interrupted by *throw*.

$\{\overset{\text{so}}{\text{throw}}\}$ *tag form*
 ▷ Have the nearest dynamically enclosing *catch* with a tag *eq tag* return with the values of *form*.

$\{\overset{\text{Fu}}{\text{sleep}}\}$ *n* ▷ Wait *n* seconds, return NIL.

9.6 Iteration

$\{\overset{\text{M}}{\text{do}}^*\}$ $\left(\left\{\left\{\text{var}\right.\right\}^* \left(\text{start } [\text{step}]\right)\right)^* \left(\text{stop } \text{result}^{\text{P}}\right) \left(\text{declare } \widehat{\text{decl}}^*\right)^* \left\{\widehat{\text{tag}}\right.\right\}^* \left\{\widehat{\text{form}}\right.\right\}^*$
 ▷ Evaluate *tagbody*-like body with *vars* successively bound according to the values of the corresponding *start* and *step* forms. *vars* are bound in parallel/sequentially, respectively. Stop iteration when *stop* is T. Return values of result. Implicitly, the whole form is a *block* named *NIL*.

$\{\overset{\text{M}}{\text{dotimes}}\}$ $\left(\text{var } i [\text{result}] \left(\text{declare } \widehat{\text{decl}}^*\right)^* \left\{\widehat{\text{tag}}\text{form}\right.\right)^*$
 ▷ Evaluate *tagbody*-like body with *var* successively bound to integers from 0 to *i* - 1. Upon evaluation of *result*, *var* is *i*. Implicitly, the whole form is a *block* named *NIL*.

▷ Print *foo* to *stream* and return *foo*, or print *foo* into *string*, respectively, after dynamically setting printer variables corresponding to keyword parameters (**print-bar** becoming *:bar*). (*:stream* keyword with *write* only.)

$\{\overset{\text{Fu}}{\text{pprint-fill}}\}$ *stream foo [parenthesis] [noop]*
 $\{\overset{\text{Fu}}{\text{pprint-tabular}}\}$ *stream foo [parenthesis] [noop] [n]*
 $\{\overset{\text{Fu}}{\text{pprint-linear}}\}$ *stream foo [parenthesis] [noop]*

▷ Print *foo* to *stream*. If *foo* is a list, print as many elements per line as possible; do the same in a table with a column width of *n* ems; or print either all elements on one line or each on its own line, respectively. Return NIL. Usable with *format* directive *~//*.

$\{\overset{\text{M}}{\text{pprint-logical-block}}\}$ $\left(\text{stream } \text{list} \left\{\left\{\begin{array}{l} \text{:prefix } \text{string} \\ \text{:per-line-prefix } \text{string} \\ \text{:suffix } \text{string} \end{array}\right.\right\}\right)\right)$

$\left(\text{declare } \widehat{\text{decl}}^*\right)^* \text{form}^{\text{P}}$
 ▷ Evaluate *forms*, which should print *list*, with *stream* locally bound to a pretty printing stream which outputs to the original *stream*. If *list* is in fact not a list, it is printed by *write*. Return NIL.

$\{\overset{\text{M}}{\text{pprint-pop}}\}$
 ▷ Take *next element* off *list*. If there is no remaining tail of *list*, or **print-length** or **print-circle** indicate printing should end, send element together with an appropriate indicator to *stream*.

$\{\overset{\text{Fu}}{\text{pprint-tab}}\}$ $\left\{\begin{array}{l} \text{:line} \\ \text{:line-relative} \\ \text{:section} \\ \text{:section-relative} \end{array}\right\} c i [\text{stream-} \text{var-} \text{standard-output}]$
 ▷ Move cursor forward to column number $c + ki$, $k \geq 0$ being as small as possible.

$\{\overset{\text{Fu}}{\text{pprint-indent}}\}$ $\left\{\begin{array}{l} \text{:block} \\ \text{:current} \end{array}\right\} n [\text{stream-} \text{var-} \text{standard-output}]$
 ▷ Specify indentation for innermost logical block relative to leftmost position/to current position. Return NIL.

$\{\overset{\text{M}}{\text{pprint-exit-if-list-exhausted}}\}$
 ▷ If *list* is empty, terminate logical block. Return NIL otherwise.

$\{\overset{\text{Fu}}{\text{pprint-newline}}\}$ $\left\{\begin{array}{l} \text{:linear} \\ \text{:fill} \\ \text{:miser} \\ \text{:mandatory} \end{array}\right\} [\text{stream-} \text{var-} \text{standard-output}]$

▷ Print a conditional newline if *stream* is a pretty printing stream. Return NIL.

var **print-array** ▷ If T, print arrays *readably*.

var **print-base**₁₀ ▷ Radix for printing rationals, from 2 to 36.

var **print-case**_{upcase}
 ▷ Print symbol names all uppercase (*:upcase*), all lowercase (*:downcase*), capitalized (*:capitalize*).

var **print-circle**_{NIL}
 ▷ If T, avoid indefinite recursion while printing circular structure.

var **print-escape**_¶
 ▷ If *NIL*, do not print escape characters and package prefixes.

var **print-gensym**_¶
 ▷ If T, print *#:* before uninterned symbols.

var **print-length**_{NIL}
var **print-level**_{NIL}
var **print-lines**_{NIL}
 ▷ If integer, restrict printing of objects to that number of elements per level/to that depth/to that number of lines.

var **print-miser-width**
 ▷ Width below which a compact pretty-printing style is used.

#+feature when-feature

#-feature unless-feature

▷ Means *when-feature* if *feature* is T, means *unless-feature* if *feature* is NIL. *feature* is a symbol from ***features***, or ({**and**|**or**} *feature**), or (**not** *feature*).

^{var}***features***

▷ List of symbols denoting implementation-dependent features.

|*c**|; \i*c*

▷ Treat arbitrary character(s) *c* as alphabetic preserving case.

12.4 Printer

$\left\{ \begin{array}{l} \text{prin1} \\ \text{print} \\ \text{pprint} \\ \text{princ} \end{array} \right\} \text{foo} [\widetilde{\text{stream}}_{\text{var}} \text{standard-output*}]$

▷ Print *foo* to *stream* ^{Fu}readably, ^{Fu}readably between a newline and a space, ^{Fu}readably after a newline, or human-readably without any extra characters, respectively. **prin1**, **print** and **princ** return *foo*.

^{Fu}(**prin1-to-string** *foo*)

^{Fu}(**princ-to-string** *foo*)

▷ Print *foo* to *string* ^{Fu}readably or human-readably, respectively.

^{gF}(**print-object** *object* *stream*)

▷ Print *object* to *stream*. Called by the Lisp printer.

^M(**print-unreadable-object** (*foo* *stream* $\left\{ \begin{array}{l} \text{:type } \text{bool}_{\text{NIL}} \\ \text{:identity } \text{bool}_{\text{NIL}} \end{array} \right\}$) *form*^{Pk})

▷ Enclosed in #< and #>, print *foo* by means of *forms* to *stream*. Return NIL.

^{Fu}(**terpri** [*stream*_{var} *standard-output**])

▷ Output a newline to *stream*. Return NIL.

^{Fu}(**fresh-line**) [*stream*_{var} *standard-output**]

▷ Output a newline to *stream* and return T unless *stream* is already at the start of a line.

^{Fu}(**write-char** *char* [*stream*_{var} *standard-output**])

▷ Output *char* to *stream*.

$\left\{ \begin{array}{l} \text{write-string} \\ \text{write-line} \end{array} \right\} \text{string} [\widetilde{\text{stream}}_{\text{var}} \text{standard-output*}] [\left\{ \begin{array}{l} \text{:start } \text{start}_{\text{0}} \\ \text{:end } \text{end}_{\text{NIL}} \end{array} \right\}]]$

▷ Write *string* to *stream* without/with a trailing newline.

^{Fu}(**write-byte** *byte* *stream*)

▷ Write *byte* to binary *stream*.

^{Fu}(**write-sequence** *sequence* *stream* $\left\{ \begin{array}{l} \text{:start } \text{start}_{\text{0}} \\ \text{:end } \text{end}_{\text{NIL}} \end{array} \right\}$)

▷ Write elements of *sequence* to *stream*.

$\left\{ \begin{array}{l} \text{write} \\ \text{write-to-string} \end{array} \right\} \text{foo} \left\{ \begin{array}{l} \text{:array } \text{bool} \\ \text{:base } \text{radix} \\ \text{:case } \left\{ \begin{array}{l} \text{:upcase} \\ \text{:downcase} \\ \text{:capitalize} \end{array} \right\} \\ \text{:circle } \text{bool} \\ \text{:escape } \text{bool} \\ \text{:gensym } \text{bool} \\ \text{:length } \{ \text{int} | \text{NIL} \} \\ \text{:level } \{ \text{int} | \text{NIL} \} \\ \text{:lines } \{ \text{int} | \text{NIL} \} \\ \text{:miser-width } \{ \text{int} | \text{NIL} \} \\ \text{:pprint-dispatch } \text{dispatch-table} \\ \text{:pretty } \text{bool} \\ \text{:radix } \text{bool} \\ \text{:readably } \text{bool} \\ \text{:right-margin } \{ \text{int} | \text{NIL} \} \\ \text{:stream } \widetilde{\text{stream}}_{\text{var}} \text{standard-output*} \end{array} \right\}$

^M(**dolist** (*var* *list* [*result*_{so}]) (**declare** *decl*^{*})* {*tag*|*form*}^{*})

▷ Evaluate **tagbody**-like body with *var* successively bound to the elements of *list*. Upon evaluation of *result*, *var* is NIL. Implicitly, the whole form is a **block** named NIL.

9.7 Loop Facility

^M(**loop** *form*^{*})

▷ **Simple Loop**. If *forms* do not contain any atomic Loop Facility keywords, evaluate them forever in an implicit **block** named NIL.

^M(**loop** *clause*^{*})

▷ **Loop Facility**. For Loop Facility keywords see below and Figure 1.

named *n*_{NIL} ▷ Give ^Mloop's implicit ^{so}block a name.

{with $\left\{ \begin{array}{l} \text{var-s} \\ (\text{var-s}^*) \end{array} \right\}$ [*d-type*] = *foo*⁺

{and $\left\{ \begin{array}{l} \text{var-p} \\ (\text{var-p}^*) \end{array} \right\}$ [*d-type*] = *bar*^{*}

where destructuring type specifier *d-type* has the form

$\left\{ \begin{array}{l} \text{fixnum} | \text{float} | \text{T} | \text{NIL} \\ \text{of-type } \left\{ \begin{array}{l} \text{type} \\ (\text{type}^*) \end{array} \right\} \end{array} \right\}$

▷ Initialize (possibly trees of) local variables *var-s* sequentially and *var-p* in parallel.

{for|**as** $\left\{ \begin{array}{l} \text{var-s} \\ (\text{var-s}^*) \end{array} \right\}$ [*d-type*]⁺ **{and** $\left\{ \begin{array}{l} \text{var-p} \\ (\text{var-p}^*) \end{array} \right\}$ [*d-type*]^{*}

▷ Begin of iteration control clauses. Initialize and step (possibly trees of) local variables *var-s* sequentially and *var-p* in parallel. Destructuring type specifier *d-type* as with **with**.

{upfrom|**from**|**downfrom** *start*

▷ Start stepping with *start*

{upto|**downto**|**to**|**below**|**above** *form*

▷ Specify *form* as the end value for stepping.

{in|**on** *list*

▷ Bind *var* to successive elements/tails, respectively, of *list*.

by {*step*₀|*function*_{#cdr}}

▷ Specify the (positive) decrement or increment or the *function* of one argument returning the next part of the list.

= *foo* [**then** *bar*_{foo}]

▷ Bind *var* in the first iteration to *foo* and later to *bar*.

across *vector*

▷ Bind *var* to successive elements of *vector*.

being {**the**|**each**}

▷ Iterate over a hash table or a package.

{hash-key|**hash-keys** {**of**|**in**} *hash-table* [**using** (*hash-value* *value*)]

▷ Bind *var* successively to the keys of *hash-table*; bind *value* to corresponding values.

{hash-value|**hash-values** {**of**|**in**} *hash-table* [**using** (*hash-key* *key*)]

▷ Bind *var* successively to the values of *hash-table*; bind *key* to corresponding keys.

{symbol|**symbols**|**present-symbol**|**present-symbols**|**external-symbol**|**external-symbols** {**of**|**in**}

*package*_{var} ***package***

▷ Bind *var* successively to the accessible symbols, or the present symbols, or the external symbols respectively, of *package*.

{do|**doing** *form*⁺

▷ Evaluate *forms* in every iteration.

if|**when**|**unless** *test* *i-clause* {**and** *j-clause*}^{*} [**else** *k-clause* {**and** *l-clause*}^{*}] [**end**]

▷ If *test* returns T, T, or NIL, respectively, evaluate *i-clause* and *j-clauses*; otherwise, evaluate *k-clause* and *l-clauses*.

it ▷ Inside *i-clause* or *k-clause*: *value of test*.

return {*form*|**it**}

▷ Return immediately, skipping any **finally** parts, with values of *form* or **it**.

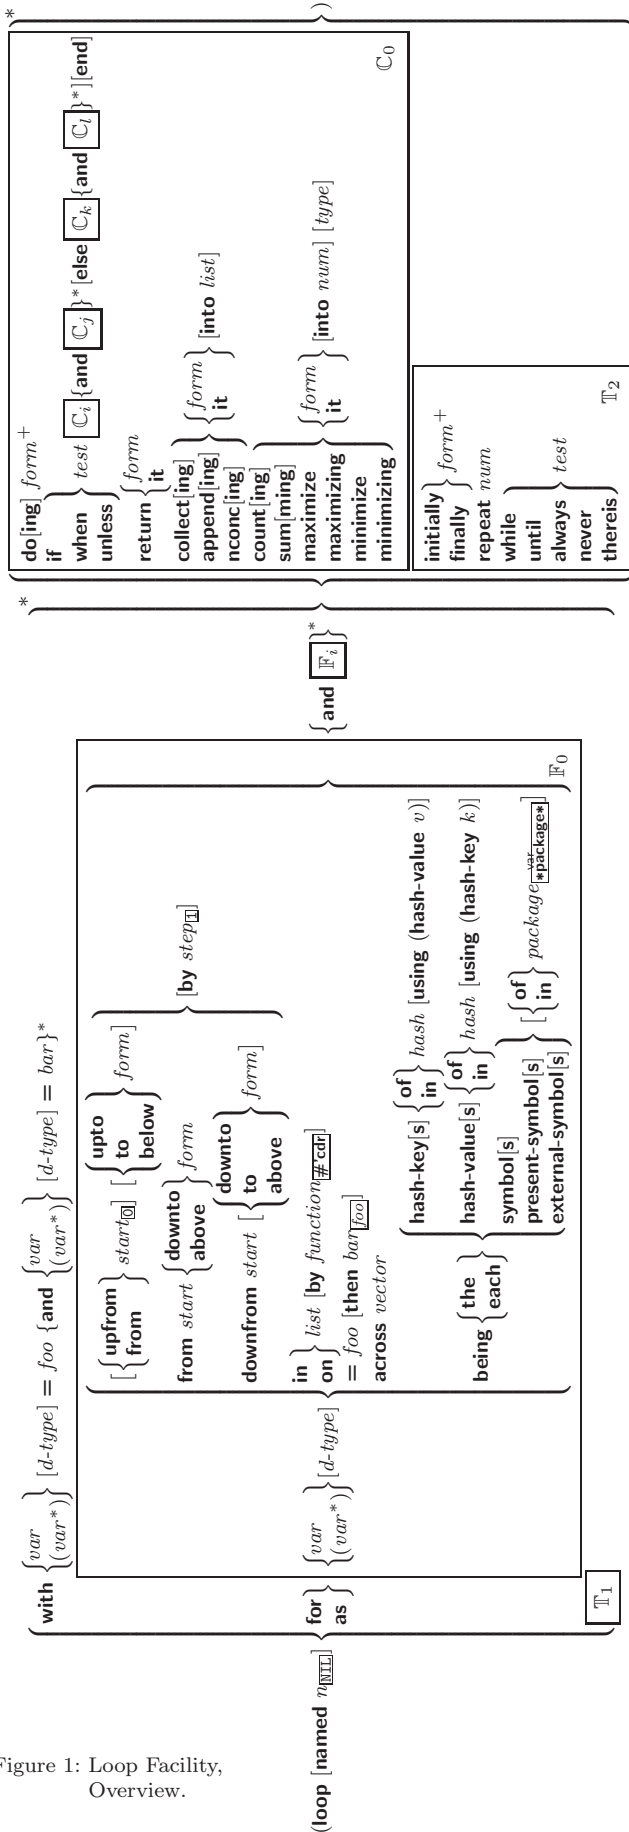

Figure 1: Loop Facility, Overview.

read-suppress \tilde{T}_1

▷ If T , reader is syntactically more tolerant.

(set-macro-character $char$ $function$ $[non-term-p_{NIL}]$ $[rt_{var}^{*readtable*}]$)

▷ Make $char$ a macro character associated with $function$.
Return T .

(get-macro-character $char$ $[rt_{var}^{*readtable*}]$)

▷ Reader macro function associated with $char$, and T if $char$ is a non-terminating macro character.

(make-dispatch-macro-character $char$ $[non-term-p_{NIL}]$ $[rt_{var}^{*readtable*}]$)

▷ Make $char$ a dispatching macro character. Return T .

(set-dispatch-macro-character $char$ $sub-char$ $function$ $[rt_{var}^{*readtable*}]$)

▷ Make $function$ a dispatch function of $char$ followed by $sub-char$. Return T .

(get-dispatch-macro-character $char$ $sub-char$ $[rt_{var}^{*readtable*}]$)

▷ Dispatch function associated with $char$ followed by $sub-char$.

12.3 Macro Characters and Escapes

#| multi-line-comment* |#

; one-line-comment*

▷ Comments. There are conventions:

;;; title ▷ Short title for a block of code.
;;; intro ▷ Description before a block of code.
:: state ▷ State of program or of following code.
; explanation ▷ Regarding line on which it appears.

(▷ Initiate reading of a list.

" ▷ Begin and end of a string.

'foo ▷ ($^{so}quote$ foo); foo unevaluated

`([foo] [bar] [, @ baz] [., \widehat{quux}] [bing])
 ▷ Backquote. $quote$ foo and $bing$; evaluate bar and splice the lists baz and $quux$ into their elements. When nested, outermost commas inside the innermost backquote expression belong to this backquote.

#\c ▷ ($^{Fu}character$ $"c"$), the character c .

#B; #O; #X; #nR ▷ Number of radix 2, 8, 16, or n .

#C(a b) ▷ ($^{Fu}complex$ a b), the complex number $a + bi$.

#'foo ▷ ($^{so}function$ foo); the function named foo .

#nAsequence ▷ n -dimensional array.

#[n](foo*)
 ▷ Vector of some (or n) $foos$ filled with last foo if necessary.

#[n]*b*
 ▷ Bit vector of some (or n) bs filled with last b if necessary.

#S(type {slot value}*) ▷ Structure of $type$.

#Pstring ▷ A pathname.

#:foo ▷ Uninterned symbol foo .

#.form ▷ Read-time value of $form$.

read-eval \tilde{T}_1 ▷ If NIL , a **reader-error** is signalled by **#.**

#int= foo ▷ Give foo the label int .

#int# ▷ Object labelled int .

#< ▷ Have the reader signal **reader-error**.

12.2 Reader

$\left\{ \begin{array}{l} \text{y-or-n-p} \\ \text{yes-or-no-p} \end{array} \right\}^{\text{Fu}} [control\ arg^*])$

▷ Ask user a question and return T or NIL depending on their answer. See p. 34, format , for *control* and *args*.

$(\text{with-standard-io-syntax } \text{form}^{\text{R}})$

▷ Evaluate *forms* with standard behaviour of reader and printer. Return values of forms.

$\left\{ \begin{array}{l} \text{read} \\ \text{read-preserving-whitespace} \end{array} \right\}^{\text{Fu}} [\widetilde{\text{stream}}^{\text{var}} \text{ *standard-input*}^{\text{var}} [\text{eof-err}^{\text{M}} [\text{eof-val}^{\text{NIL}} [\text{recursive}^{\text{NIL}}]]]])$

▷ Read printed representation of object.

$(\text{read-from-string } \text{string} [\text{eof-error}^{\text{M}} [\text{eof-val}^{\text{NIL}}$

$\left\{ \begin{array}{l} \text{:start } \text{start}^{\text{Q}} \\ \text{:end } \text{end}^{\text{NIL}} \\ \text{:preserve-whitespace } \text{bool}^{\text{NIL}} \end{array} \right\}]])$

▷ Return object read from string and zero-indexed position of next character.

$(\text{read-delimited-list } \text{char} [\widetilde{\text{stream}}^{\text{var}} \text{ *standard-input*}^{\text{var}} [\text{recursive}^{\text{NIL}}]])$

▷ Continue reading until encountering *char*. Return list of objects read. Signal error if no *char* is found in stream.

$(\text{read-char } [\widetilde{\text{stream}}^{\text{var}} \text{ *standard-input*}^{\text{var}} [\text{eof-err}^{\text{M}} [\text{eof-val}^{\text{NIL}} [\text{recursive}^{\text{NIL}}]]]])$

▷ Return next character from *stream*.

$(\text{read-char-no-hang } [\widetilde{\text{stream}}^{\text{var}} \text{ *standard-input*}^{\text{var}} [\text{eof-error}^{\text{M}} [\text{eof-val}^{\text{NIL}} [\text{recursive}^{\text{NIL}}]]]])$

▷ Next character from *stream* or NIL if none is available.

$(\text{peek-char } [\text{mode}^{\text{NIL}} [\widetilde{\text{stream}}^{\text{var}} \text{ *standard-input*}^{\text{var}} [\text{eof-error}^{\text{M}} [\text{eof-val}^{\text{NIL}} [\text{recursive}^{\text{NIL}}]]]])$

▷ Next, or if *mode* is T, next non-whitespace character, or if *mode* is a character, next instance of it, from stream without removing it there.

$(\text{unread-char } \text{character} [\widetilde{\text{stream}}^{\text{var}} \text{ *standard-input*}^{\text{var}}])$

▷ Put last read-char'd *character* back into *stream*; return NIL.

$(\text{read-byte } \text{stream} [\text{eof-err}^{\text{M}} [\text{eof-val}^{\text{NIL}}]])$

▷ Read next byte from binary *stream*.

$(\text{read-line } [\widetilde{\text{stream}}^{\text{var}} \text{ *standard-input*}^{\text{var}} [\text{eof-err}^{\text{M}} [\text{eof-val}^{\text{NIL}} [\text{recursive}^{\text{NIL}}]]]])$

▷ Return a line of text from *stream* and T if line has been ended by end of file.

$(\text{read-sequence } \text{sequence } \text{stream} [\text{:start } \text{start}^{\text{Q}}] [\text{:end } \text{end}^{\text{NIL}}])$

▷ Replace elements of *sequence* between *start* and *end* with elements from *stream*. Return index of *sequence*'s first unmodified element.

$(\text{readable-case } \text{readtable})^{\text{Fu}} \text{upcase}$

▷ Case sensitivity attribute (one of :upcase, :downcase, :preserve, :invert) of *readtable*. setfable.

$(\text{copy-readtable } [\text{from-readtable}^{\text{var}} \text{ *readtable*}^{\text{var}} [\text{to-readtable}^{\text{NIL}}]])$

▷ Return copy of from-readtable.

$(\text{set-syntax-from-char } \text{to-char } \text{from-char} [\text{to-readtable}^{\text{var}} \text{ *readtable*}^{\text{var}} [\text{from-readtable}^{\text{standard-readtable}}]])$

▷ Copy syntax of *from-char* to *to-readtable*. Return T.

$\text{var } \text{ *readtable*}$ ▷ Current readtable.

$\text{var } \text{ *read-base*}^{\text{Q}}$ ▷ Radix for reading integers and ratios.

$\text{var } \text{ *read-default-float-format*}^{\text{single-float}}$

▷ Floating point format to use when not indicated in the number read.

$\{\text{collect}|\text{collecting}\} \{ \text{form}|\text{it} \} [\text{into } \text{list}]$

▷ Collect values of *form* or *it* into *list*. If no *list* is given, collect into an anonymous list which is returned after termination.

$\{\text{append}|\text{appending}|\text{nconc}|\text{nconcing}\} \{ \text{form}|\text{it} \} [\text{into } \text{list}]$

▷ Concatenate values of *form* or *it*, which should be lists, into *list* by the means of append or nconc, respectively. If no *list* is given, collect into an anonymous list which is returned after termination.

$\{\text{count}|\text{counting}\} \{ \text{form}|\text{it} \} [\text{into } n] [\text{type}]$

▷ Count the number of times the value of *form* or of *it* is T. If no *n* is given, count into an anonymous variable which is returned after termination.

$\{\text{sum}|\text{summing}\} \{ \text{form}|\text{it} \} [\text{into } \text{sum}] [\text{type}]$

▷ Calculate the sum of the primary values of *form* or of *it*. If no *sum* is given, sum into an anonymous variable which is returned after termination.

$\{\text{maximize}|\text{maximizing}|\text{minimize}|\text{minimizing}\} \{ \text{form}|\text{it} \} [\text{into } \text{max-min}] [\text{type}]$

▷ Determine the maximum or minimum, respectively, of the primary values of *form* or of *it*. If no *max-min* is given, use an anonymous variable which is returned after termination.

$\{\text{initially}|\text{finally}\} \text{form}^+$

▷ Evaluate *forms* before begin, or after end, respectively, of iterations.

repeat *num*

▷ Terminate loop after *num* iterations; *num* is evaluated once.

$\{\text{while}|\text{until}\} \text{test}$

▷ Continue iteration until *test* returns NIL or T, respectively.

$\{\text{always}|\text{never}\} \text{test}$

▷ Terminate loop returning NIL and skipping any finally parts as soon as *test* is NIL or T, respectively. Otherwise continue loop with its default return value set to T.

thereis *test*

▷ Terminate loop when *test* is T and return value of *test*, skipping any finally parts. Otherwise continue loop with its default return value set to NIL.

$(\text{loop-finish})^{\text{M}}$

▷ Terminate loop immediately executing any finally clauses and returning any accumulated results.

10 CLOS

10.1 Classes

$(\text{slot-exists-p } \text{foo } \text{bar})^{\text{Fu}}$ ▷ T if *foo* has a slot *bar*.

$(\text{slot-boundp } \text{instance } \text{slot})^{\text{Fu}}$ ▷ T if *slot* in *instance* is bound.

$(\text{defclass } \text{foo } (\text{superclass}^* \text{ *standard-object*}))$

$\left(\text{slot} \left(\left(\begin{array}{l} \text{:reader } \text{reader}^* \\ \text{:writer } \left(\begin{array}{l} \text{writer} \\ \text{:setf } \text{writer} \end{array} \right)^* \\ \text{:accessor } \text{accessor}^* \\ \text{:allocation } \left(\begin{array}{l} \text{:instance} \\ \text{:class} \end{array} \right) \text{ *instance*} \\ \text{:initarg } \text{initarg-name}^* \\ \text{:initform } \text{form} \\ \text{:type } \text{type} \\ \text{:documentation } \text{slot-doc} \end{array} \right) \right) \right)^*$

▷ Define, as a subclass of *superclasses*, class *foo*. In a new instance *i*, a *slot*'s value defaults to *form* unless set via *:initarg-name*; it is readable via (*reader* *i*) or (*accessor* *i*), and writeable via (*writer* *i* *value*) or (*setf* (*accessor* *i*) *value*). With *:allocation* *:class*, *slot* is shared by all instances of class *foo*.

(^{Fu}**find-class** *symbol* [*errorp* _T [*environment*]])
 ▷ Return class named *symbol*. **setfable**.

(^F**make-instance** *class* {:*initarg* *value*}* *other-keyarg**)
 ▷ Make new instance of *class*.

(^F**reinitialize-instance** *instance* {:*initarg* *value*}* *other-keyarg**)
 ▷ Change local slots of *instance* according to *initargs*.

(^{Fu}**slot-value** *foo* *slot*) ▷ Return value of *slot* in *foo*. **setfable**.

(^{Fu}**slot-makunbound** *instance* *slot*)
 ▷ Make *slot* in *instance* unbound.

(^M**with-slots** ({*slot* (*var* *slot*)}*)
^M**with-accessors** ((*var* *accessor*)*}) *instance* (*declare* *decl*)*
^F*form**)
 ▷ Return values of *forms* after evaluating them in a lexical environment with slots of *instance* visible as **setfable** *slots* or *vars*/with *accessors* of *instance* visible as **setfable** *vars*.

(^F**class-name** *class*)
 ((^F**setf class-name**) *new-name* *class*) ▷ Get/set name of *class*.

(^{Fu}**class-of** *foo*) ▷ Class *foo* is a direct instance of.

(^F**change-class** *instance* *new-class* {:*initarg* *value*}* *other-keyarg**)
 ▷ Change class of *instance* to *new-class*.

(^F**make-instances-obsolete** *class*)
 ▷ Update instances of *class*.

(^F**initialize-instance** (*instance*)
^F**update-instance-for-different-class** *previous* *current*)
 {:*initarg* *value*}* *other-keyarg**)
 ▷ Its primary method sets slots on behalf of **make-instance**/of **change-class** by means of **shared-initialize**.

(^F**update-instance-for-redefined-class** *instances* *added-slots*
discarded-slots *property-list* {:*initarg* *value*}*
*other-keyarg**)
 ▷ Its primary method sets slots on behalf of **make-instances-obsolete** by means of **shared-initialize**.

(^F**allocate-instance** *class* {:*initarg* *value*}* *other-keyarg**)
 ▷ Return uninitialized instance of *class*. Called by **make-instance**.

(^F**shared-initialize** *instance* {_T *slots*} {:*initarg* *value*}* *other-keyarg**)
 ▷ Fill *instance*'s *slots* using *initargs* and **initform** forms.

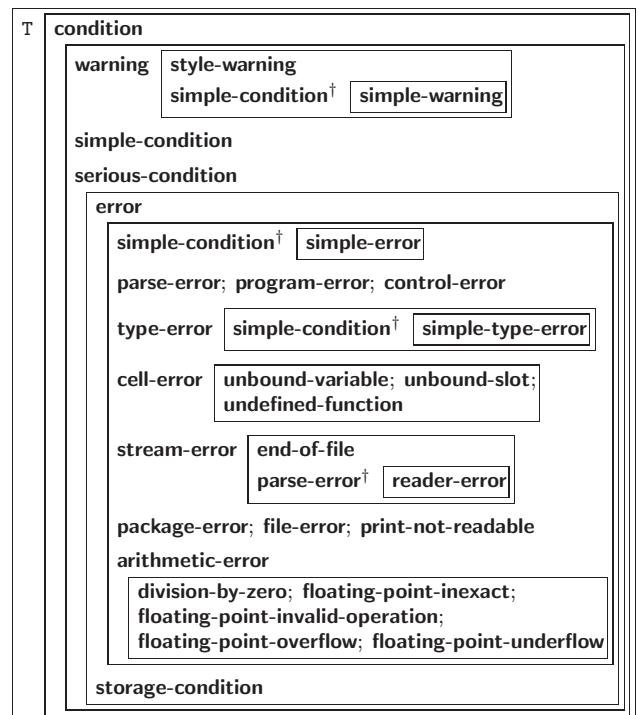

(^F**slot-missing** *class* *object* *slot* {_T *setf* *slot-boundp* *slot-makunbound* *slot-value*} [*value*])
 ▷ Called in case of attempted access to missing *slot*. Its primary method signals **error**.

(^F**slot-unbound** *class* *instance* *slot*)
 ▷ Called by **slot-value** in case of unbound *slot*. Its primary method signals **unbound-slot**.

10.2 Generic Functions

(^{Fu}**next-method-p**)
 ▷ T if enclosing method has a next method.

(^M**defgeneric** {*foo* (*setf* *foo*)} (*required-var** [**&optional** {*var* (*var*)}*]
 [**&rest** *var*] [**&key** {*var* (*var* (*key* *var*))}*]
 [**&allow-other-keys**])

†For supertypes of this type look for the instance without a †.

Figure 2: Condition Types.

(^{Fu}**type-error-datum** *condition*)
 (^{Fu}**type-error-expected-type** *condition*)
 ▷ Object which caused *condition* of type **type-error**, or its expected type, respectively.

(^{Fu}**simple-condition-format-control** *condition*)
 (^{Fu}**simple-condition-format-arguments** *condition*)
 ▷ Return format control or list of format arguments, respectively, of *condition*.

^{var}***break-on-signals***_{NIL}
 ▷ Condition type debugger is to be invoked on.

^{var}***debugger-hook***_{NIL}
 ▷ Function of condition and function itself. Called before debugger.

12 Input/Output

12.1 Predicates

(^{Fu}**stream** *foo*)
 (^{Fu}**pathnamep** *foo*) ▷ T if *foo* is of indicated type.
 (^{Fu}**readtablep** *foo*)

(^{Fu}**input-stream-p** *stream*)
 (^{Fu}**output-stream-p** *stream*)
 (^{Fu}**interactive-stream-p** *stream*)
 (^{Fu}**open-stream-p** *stream*)
 ▷ Return T if *stream* is for input, for output, interactive, or open, respectively.

(^{Fu}**pathname-match-p** *path* *wildcard*)
 ▷ T if *path* matches *wildcard*.

(^{Fu}**wild-pathname-p** *path* [{:*host*|:*device*|:*directory*|:*name*|:*type*|:*version*|NIL}])
 ▷ Return T if indicated component in *path* is wildcard. (NIL indicates any component.)

(^M**with-simple-restart** ($\left\{ \begin{smallmatrix} \text{restart} \\ \text{NIL} \end{smallmatrix} \right\}$ *control arg**) *form*^{R*})

▷ Return values of forms unless *restart* is called during their evaluation. In this case, describe restart using ^{Fu}**format** *control* and *args* (see p. 34) and return ^{Fu}**NIL** and ^T.

(^M**restart-case** *form* (*foo* (*ord*-λ*)) $\left\{ \begin{smallmatrix} \text{:interactive } \text{arg-function} \\ \text{:report } \left\{ \begin{smallmatrix} \text{report-function} \\ \text{string}^{\text{foo}} \end{smallmatrix} \right\} \\ \text{:test } \text{test-function}^{\text{foo}} \end{smallmatrix} \right\}$

(**declare** $\widehat{\text{decl}}^*$)^{R*} *restart-form*^{R*})

▷ Evaluate *form* with dynamically established restarts *foo*. Return values of *form* or, if by (**invoke-restarts** *foo arg**) one restart *foo* is called, use *string* or *report-function* (of a stream) to print a description of restart *foo* and return the values of its *restart-forms*. *arg-function* supplies appropriate *args* if *foo* is called by **invoke-restart-interactively**. If (*test-function condition*) returns T, *foo* is made visible under *condition*. For (*ord*-λ*) see p. 16.

(^M**restart-bind** ($\left\{ \begin{smallmatrix} \text{restart} \\ \text{NIL} \end{smallmatrix} \right\}$ *restart-function*

$\left\{ \begin{smallmatrix} \text{:interactive-function } \text{function} \\ \text{:report-function } \text{function} \\ \text{:test-function } \text{function} \end{smallmatrix} \right\}$ *) *form*^{R*})

▷ Return values of forms evaluated with *restarts* dynamically bound to *restart-functions*.

(^{Fu}**invoke-restart** *restart arg**)

(^{Fu}**invoke-restart-interactively** *restart*)

▷ Call function associated with *restart* with arguments given or prompted for, respectively. If *restart* function returns, return its values.

(^{Fu}**compute-restarts** [*condition*])

(^{Fu}**find-restart** *name*)

▷ Return list of all restarts, or innermost restart *name*, respectively, out of those either associated with *condition* or un-associated at all; or, without *condition*, out of all restarts. Return ^{Fu}**NIL** if search is unsuccessful.

(^{Fu}**restart-name** *restart*) ▷ Name of restart.

(^{Fu}**abort** [*condition*])

(^{Fu}**muffle-warning** [*condition*])

(^{Fu}**continue** [*condition*])

(^{Fu}**store-value** *value*)

(^{Fu}**use-value** *value*)

▷ Transfer control to innermost applicable restart with same name (i.e. **abort**, ..., **continue** ...) out of those either associated with *condition* or un-associated at all; or, without *condition*, out of all restarts. If no restart is found, signal **control-error** for ^{Fu}**abort** and ^{Fu}**muffle-warning**, or return ^{Fu}**NIL** for the rest.

(^M**with-condition-restarts** *condition restarts form*^{R*})

▷ Evaluate *forms* with *restarts* dynamically associated with *condition*. Return values of forms.

(^{Fu}**arithmetic-error-operation** *condition*)

(^{Fu}**arithmetic-error-operands** *condition*)

▷ List of function or of its operands respectively, used in the operation which caused *condition*.

(^{Fu}**cell-error-name** *condition*)

▷ Name of cell which caused *condition*.

(^{Fu}**unbound-slot-instance** *condition*)

▷ Instance with unbound slot which caused *condition*.

(^{Fu}**print-not-readable-object** *condition*)

▷ The object not readably printable under *condition*.

(^{Fu}**package-error-package** *condition*)

(^{Fu}**file-error-pathname** *condition*)

(^{Fu}**stream-error-stream** *condition*)

▷ Package, path, or stream, respectively, which caused the *condition* of indicated type.

$\left\{ \begin{smallmatrix} \text{:argument-precedence-order } \text{required-var}^+ \\ \text{:declare } (\text{optimize } \text{arg}^*)^+ \\ \text{:documentation } \text{string} \\ \text{:generic-function-class } \text{class}^{\text{standard-generic-function}} \\ \text{:method-class } \text{class}^{\text{standard-method}} \\ \text{:method-combination } \text{c-type}^{\text{standard}} \text{ c-arg}^* \\ \text{:method } \text{defmethod-args}^* \end{smallmatrix} \right\}$

▷ Define generic function *foo*. *defmethod-args* resemble those of **defmethod**. For *c-type* see section 10.3.

(^{Fu}**ensure-generic-function** $\left\{ \begin{smallmatrix} \text{foo} \\ \text{(setf foo)} \end{smallmatrix} \right\}$

$\left\{ \begin{smallmatrix} \text{:argument-precedence-order } \text{required-var}^+ \\ \text{:declare } (\text{optimize } \text{arg}^*)^+ \\ \text{:documentation } \text{string} \\ \text{:generic-function-class } \text{class} \\ \text{:method-class } \text{class} \\ \text{:method-combination } \text{c-type } \text{c-arg}^* \\ \text{:lambda-list } \text{lambda-list} \\ \text{:environment } \text{environment} \end{smallmatrix} \right\}$

▷ Define or modify generic function *foo*. **:generic-function-class** and **:lambda-list** have to be compatible with a pre-existing generic function or with existing methods, respectively. Changes to **:method-class** do not propagate to existing methods. For *c-type* see section 10.3.

(^M**defmethod** $\left\{ \begin{smallmatrix} \text{foo} \\ \text{(setf foo)} \end{smallmatrix} \right\}$ $\left[\left\{ \begin{smallmatrix} \text{:before} \\ \text{:after} \\ \text{:around} \end{smallmatrix} \right\} \left[\begin{smallmatrix} \text{primary method} \\ \text{qualifier}^* \end{smallmatrix} \right] \right]$

$\left(\begin{smallmatrix} \text{var} \\ \text{(spec-var } \left\{ \begin{smallmatrix} \text{class} \\ \text{(eql bar)} \end{smallmatrix} \right\}) \end{smallmatrix} \right)^* \left[\text{\&optional} \right]$

$\left(\begin{smallmatrix} \text{var} \\ \text{(var [init [supplied-p]])} \end{smallmatrix} \right)^* \left[\text{\&rest var} \right] \left[\text{\&key} \right]$

$\left(\begin{smallmatrix} \text{var} \\ \text{(var [init [supplied-p]])} \end{smallmatrix} \right)^* \left[\text{\&allow-other-keys} \right]$

$\left[\text{\&aux } \left(\begin{smallmatrix} \text{var} \\ \text{(var [init])} \end{smallmatrix} \right)^* \right] \left[\left(\begin{smallmatrix} \text{declare } \widehat{\text{decl}}^* \\ \text{doc} \end{smallmatrix} \right)^* \right] \text{form}^{\text{R*}}$

▷ Define new method for generic function *foo*. *spec-vars* specialize to either being of *class* or being **eql** *bar*, respectively. On invocation, *vars* and *spec-vars* of the new method act like parameters of a function with body *form*^{*}. *forms* are enclosed in an implicit ^{Fu}**block** *foo*. Applicable *qualifiers* depend on the **method-combination** type; see section 10.3.

(^{GF}**add-method** *generic-function method*)

(^{GF}**remove-method** *generic-function method*)

▷ Add (if necessary) or remove (if any) *method* to/from *generic-function*.

(^{GF}**find-method** *generic-function qualifiers specializers* [*error*])

▷ Return suitable method, or signal **error**.

(^{GF}**compute-applicable-methods** *generic-function args*)

▷ List of methods suitable for *args*, most specific first.

(^{Fu}**call-next-method** *arg** [*current args*])

▷ From within a method, call next method with *args*; return its values.

(^{GF}**no-applicable-method** *generic-function arg**)

▷ Called on invocation of *generic-function* on *args* if there is no applicable method. Default method signals **error**.

(^{Fu}**invalid-method-error** *method*)

(^{Fu}**method-combination-error** *method*)

▷ Signal **error** on applicable method with invalid qualifiers, or on method combination. For *control* and *args* see **format**, p. 34.

(^{GF}**no-next-method** *generic-function method arg**)

▷ Called on invocation of **call-next-method** when there is no next method. Default method signals **error**.

(^{gF}**function-keywords** *method*)

▷ Return list of keyword parameters of *method* and \mathbb{T} if other keys are allowed.

(^{GF}**method-qualifiers** *method*) ▷ List of qualifiers of *method*.

10.3 Method Combination Types

standard

▷ Evaluate most specific **:around** method supplying the values of the generic function. From within this method, **call-next-method**_{Fu} can call less specific **:around** methods if there are any. If not, or if there are no **:around** methods at all, call all **:before** methods, most specific first, and the most specific primary method which supplies the values of the calling **call-next-method**_{Fu} if any, or of the generic function; and which can call less specific primary methods via **call-next-method**. After its return, call all **:after** methods, least specific first.

and|or|append|list|nconc|progn|max|min|+

▷ Simple built-in **method-combination** types; have the same usage as the *c-types* defined by the short form of `define-method-combination`.

(^Mdefine-method-combination *c-type*

$$\left\{ \begin{array}{l} \text{:documentation } \widehat{\text{string}} \\ \text{:identity-with-one-argument } \text{bool}_{\text{NFI}} \\ \text{:operator } \text{operator}_{\text{c-type}} \end{array} \right\}$$

▷ **Short Form.** Define new **method-combination** *c-type*. In a generic function using *c-type*, evaluate most specific **:around** method supplying the values of the generic function. From within this method, **call-next-method** can call less specific **:around** methods if there are any. If not, or if there are no **:around** methods at all, have generic function applied to *gen-arg** return with the values of (*c-type* {*primary-method* *gen-arg**}^{*}), leftmost *primary-method* being the most specific. In **defmethod**, primary methods are denoted by the *qualifier c-type*.

$$(\text{define-method-combination } c\text{-type } (ord-\lambda^*) ((group$$
$$\left\{ \begin{array}{l} * \\ (qualifier^* \ [*]) \\ predicate \end{array} \right\}$$

$$\left\{ \begin{array}{l} :description \ control \\ :order \ \left\{ \begin{array}{l} :most-specific-first \\ :most-specific-last \end{array} \right\} \boxed{:most-specific-first} \\ :required \ bool \end{array} \right\}^*)$$

$$\left\{ \begin{array}{l} (:arguments \ method-combination-\lambda^*) \\ (:generic-function \ symbol) \\ (\underline{declare} \ decl^*)^* \\ \underline{doc} \end{array} \right\} body^{\mathbb{P}_k^*}$$

▷ **Long Form.** Define new **method-combination** *c-type*. A call to a generic function using *c-type* will be equivalent to a call to the forms returned by *body** with *ord-λ** bound to *c-arg** (cf. **defgeneric**), with *symbol* bound to the generic function, with *method-combination-λ** bound to the arguments of the generic function, and with *groups* bound to lists of methods. An applicable method becomes a member of the leftmost *group* whose *predicate* or *qualifiers* match. Methods can be called via **call-method**. Lambda lists (*ord-λ**) and (*method-combination-λ**) according to *ord-λ* on p. 16, the latter enhanced by an optional **&whole** argument.

$$(\text{call-method}^{\text{M}} \left\{ \widehat{\text{method}}^{\text{M}}_{\text{make-method form}} \right\}) \left[\left(\left\{ \widehat{\text{next-method}}^{\text{M}}_{\text{make-method form}} \right\}^* \right) \right]$$

▷ From within an effective method form, call *method* with the arguments of the generic function and with information about its *next-methods*; return its values.

11 Conditions and Errors

$$(\text{define-condition } foo \ (parent\text{-}type^* \boxed{\text{condition}})$$
$$\left\{ \begin{array}{l} \text{slot} \\ \left\{ \begin{array}{l} \{ \text{:reader } \textit{reader} \}^* \\ \{ \text{:writer } \textit{writer} \}^* \\ \{ \text{:accessor } \textit{accessor} \}^* \\ \text{:allocation } \left\{ \begin{array}{l} \text{:instance} \\ \text{:class} \end{array} \right\} \\ \{ \text{:initarg } \textit{initarg-name} \}^* \\ \text{:initform } \textit{form} \\ \text{:type } \textit{type} \\ \text{:documentation } \textit{slot-doc} \end{array} \right\} \end{array} \right\}^*$$

▷ Define, as a subtype of *parent-types*, condition type *foo*. In a new condition, a *slot's* value defaults to *form* unless set via *:initarg-name*; it is readable via (*reader i*) or (*accessor i*), and writeable via (*writer i value*) or (**setf** (*accessor i value*)). With **:allocation :class**, *slot* is shared by all conditions of type *foo*. A condition is reported by *string* or by *report-function* of arguments condition and stream.

$$(\text{make-condition } type \{ :initarg-name \textit{value} \}^*)$$

▷ Return new condition of *type*.

$$\left(\begin{array}{c} \text{Fu} \\ \text{signal} \\ \text{Fu} \\ \text{warn} \\ \text{Fu} \\ \text{error} \end{array} \right) \left\{ \begin{array}{l} \text{condition} \\ \text{type } \{:\text{initarg-name value}\}^* \\ \text{control arg}^* \end{array} \right\}$$

▷ Unless handled, signal as **condition**, **warning** or **error**, respectively, *condition* or a new condition of *type* or, with **format** *control* and *args* (see p. 34), **simple-condition**, **simple-warning**, or **simple-error**, respectively. From **signal** _{Fu} and **warn** _{Fu}, return NIL.

$$(\text{Fu } \textbf{error} \text{ continue-control } \left\{ \begin{array}{l} \text{condition continue-arg}^* \\ \text{type } \{:\text{initarg-name value}\}^* \\ \text{control arg}^* \end{array} \right\})$$

▷ Unless handled, signal as correctable **error condition** or a new condition of *type* or, with **format control** and *args* (see p. 34), **simple-error**. In the debugger, use **format** arguments *continue-control* and *continue-args* to tag the continue option. Return NIL.

$$(\text{ignore-errors } form^{P_*})^M$$

▷ Return values of forms or, in case of **errors**, NIL and the condition.

$$(\text{invoke-debugger}^{\text{Fu}} \text{ condition})$$

- ▷ Invoke debugger with *condition*.

$$(\text{assert}^M \text{ test } [(place^*) [\left\{ \begin{array}{l} \text{condition } \text{continue-arg}^* \\ \text{type } \{:\text{initarg-name value}\}^* \\ \text{control } \text{arg}^* \end{array} \right\}]])$$

▷ If *test*, which may depend on *places*, returns NIL, signal as correctable **error condition** or a new condition of *type* or, with **format** *control* and *args* (see p. 34), **error**. When using the debugger's continue option, *places* can be altered before re-evaluation of *test*. Return NIL.

$$(\text{handler-case test (type ([var]) (\widehat{\text{declare decl}}^*)^* \text{condition-form}^{\text{P}}))^* \\ [(:\text{no-error (ord-}\lambda^* (\widehat{\text{declare decl}}^*)^* \text{form}^{\text{P}}))])$$

▷ If, on evaluation of *test*, a condition of *type* is signalled, evaluate matching *condition-forms* with *var* bound to the condition, and return their values. Without a condition, bind *ord*- λ s to values of *test* and return values of *forms* or, without a **:no-error** clause, return values of *test*. See p. 16 for (*ord*- λ^*).

$$(\text{handler-bind}^M ((\text{condition-type handler-function})^*) \text{form}^P_*)$$

- ▷ Return values of forms after evaluating them with *condition-types* dynamically bound to their respective *handler-functions* of argument condition.
